Duality Symmetry Ivan Fernandez-Corbaton, 2020-12-10 Symmetry is one of the most general concepts in physics Symmetry arguments are used to explain and predict observations at all length scales from elementary particles to cosmology The generality of symmetry arguments combined with their simplicity makes them a powerful tool for both fundamental and applied investigations In electrodynamics one of the symmetries is the invariance of the equations under exchange of electric and magnetic quantities The continuous version of this symmetry is most commonly known as electromagnetic duality symmetry This concept has been accepted for more than a century and throughout this time has influenced other areas of physics like high energy physics and gravitation This Special Issue is devoted to electromagnetic duality symmetry and other varieties of dualities in physics It contains four Articles one Review and one Perspective The context of the contributions ranges from string theory to applied nanophotonics which as anticipated shows that duality symmetries in general and electromagnetic duality symmetry in particular are useful in a wide variety of physics fields both theoretical and applied Moreover a number of the contributions show how the use of symmetry arguments and the quantification of symmetry breaking can successfully guide our theoretical understanding and provide us with guidelines for system design

Energy Research Abstracts ,1989 **Field Guide to Polarization** Edward Collett, 2005 The polarization of light is one of the most remarkable phenomena in nature and has led to numerous discoveries and applications The nature and

mathematical formulation of unpolarized light and partially polarized light were not readily forthcoming until the 1950s when questions about polarized light and the mathematical tools to deal with it began to be addressed in earnest. As a result, there is a very good understanding of polarized light today. The primary objective of this guide is to provide an introduction to the developments in polarized light that have taken place over the past half century and present the most salient topics of the subject matter such as Mueller matrices, Stokes polarization parameters, and Jones matrices.

The past two decades have seen significant innovation in teaching methods for science, technology, engineering, and mathematics (STEM) fields. This innovation has been driven by development of new educational technologies and methods that were accelerated in 2020 and 2021 by the explosion of remote teaching due to COVID-19. The teaching of optics, being a highly specialized STEM field, has much in common with other areas but has its own unique challenges. This volume explores individual experiences with the development of methods and their application to the teaching of optics, especially in higher education. The volume is dedicated to the memory of Professor John Greivenkamp, who passed away in early 2022 and was among the best known and most passionate educators of optics in the world.
