Project and Cost Engineers' Handbook, Third Edition, Kenneth

King Humphreys, Lloyd M. English, 1992-11-19 Designed as a day to day resource for practitioners and a self study guide for the AACE International Cost Engineers certification examination This third edition has been revised and expanded and topics covered include project evaluation project management and planning and scheduling **Chemical Engineering Design**

Ray Sinnott, 2014-06-28 This 2nd Edition of Coulson agitated vessels are now covered and the discussion of fired heaters and plate heat exchangers extended The appendices have been extended to include a computer program for energy balances illustrations of equipment specification sheets and heat exchanger tube layout diagrams This 2nd Edition will continue to provide undergraduate students of chemical engineering chemical engineers in industry and chemists and mechanical engineers who have to tackle problems arising in the process industries with a valuable text on how a complete process is designed and how it must be fitted into the environment **Integration and Optimization of Unit Operations** Barry A. Perlmutter, 2022-06-24 The chemical industry changes and becomes more and more integrated worldwide This creates a need for information exchange that includes not only the principles of operation but also the transfer of practical knowledge Integration and Optimization of Unit Operations provides up to date and practical information on chemical unit operations from the R D stage to scale up and demonstration to commercialization and optimization A global collection of industry experts systematically discuss all innovation stages complex processes with different unit operations including solids processing and recycle flows and the importance of integrated process validation The book addresses the needs of engineers who want to increase their skill levels in various disciplines so that they are able to develop commercialize and optimize processes After reading this book you will be able to acquire new skills and knowledge to collaborate across disciplines and develop creative solutions Shows the impacts of upstream process decisions on downstream operations Provides troubleshooting strategies at each process stage Asks challenging questions to develop creative solutions to process problems Precision Metal Additive Manufacturing Richard Leach, Simone Carmignato, 2020-09-21 Additive manufacturing AM is a fast growing sector with the ability to evoke a revolution in manufacturing due to its almost unlimited design freedom and its capability to produce personalised parts locally and with efficient material use AM companies however still face technological challenges such as limited precision due to shrinkage built in stresses and limited process stability and robustness Moreover often post processing is needed due to high roughness and remaining porosity Qualified trained personnel are also in short supply In recent years there have been dramatic improvements in AM design methods process control post processing material properties and material range However if AM is going to gain a significant market share it must be developed into a true precision manufacturing method The production of precision parts relies on three principles Production is robust i e all sensitive parameters can be controlled Production is predictable for example the shrinkage that occurs is acceptable because it can be predicted and compensated in the design Parts are measurable as without metrology accuracy repeatability and quality assurance cannot be known AM of metals is inherently a high energy process with many

sensitive and inter related process parameters making it susceptible to thermal distortions defects and process drift The complete modelling of these processes is beyond current computational power and novel methods are needed to practicably predict performance and inform design In addition metal AM produces highly textured surfaces and complex surface features that stretch the limits of contemporary metrology With so many factors to consider there is a significant shortage of background material on how to inject precision into AM processes Shortage in such material is an important barrier for a wider uptake of advanced manufacturing technologies and a comprehensive book is thus needed This book aims to inform the reader how to improve the precision of metal AM processes by tackling the three principles of robustness predictability and metrology and by developing computer aided engineering methods that empower rather than limit AM design Richard Leach is a professor in metrology at the University of Nottingham and heads up the Manufacturing Metrology Team Prior to this position he was at the National Physical Laboratory from 1990 to 2014 His primary love is instrument building from concept to final installation and his current interests are the dimensional measurement of precision and additive manufactured structures His research themes include the measurement of surface topography the development of methods for measuring 3D structures the development of methods for controlling large surfaces to high resolution in industrial applications and the traceability of X ray computed tomography He is a leader of several professional societies and a visiting professor at Loughborough University and the Harbin Institute of Technology Simone Carmignato is a professor in manufacturing engineering at the University of Padua His main research activities are in the areas of precision manufacturing dimensional metrology and industrial computed tomography He is the author of books and hundreds of scientific papers and he is an active member of leading technical and scientific societies He has been chairman organiser and keynote speaker for several international conferences and received national and international awards including the Taylor Medal from CIRP the International Academy for Production Engineering

Cost Engineering for Pollution Prevention and Control Paul Mac Berthouex, Linfield C. Brown, 2021-05-13 Environmental engineers work to increase the level of health and happiness in the world by designing building and operating processes and systems for water treatment water pollution control air pollution control and solid waste management These projects compete for resources with projects in medicine transportation education and other fields that have a similar objective The challenge is to make the investments efficient to get the best project outputs with a minimum of inputs Cost Engineering for Pollution Prevention and Control examines how to identify the best solution by judging alternatives with respect to some measure of system performance such as total capital cost annual cost annual net profit return on investment cost benefit ratio net present worth minimum production time maximum production rate minimum energy utilization and so on Key Features Explains how to estimate preliminary costs how to compare the life cycle costs of alternative projects how to find the optimal balance between capital costs and operating costs Emphasis is placed on formulating the problem rather than on the mathematical details of how the calculations are done Provides numerous practical examples and case studies Includes end of chapter exercises dealing with water wastewater air pollution solid wastes and remediation projects The important concepts presented in this book can be understood by those students who have taken an introductory course in environmental engineering Advanced knowledge of process design is not required The material can also be utilized by engineers managers and others who would benefit from a better understanding of how engineers look at problems
