Strong, 2013-03-12 Modern electronics is the most visible result of research in solid state physics Transistors and integrated circuits are used everywhere in ever increasing numbers The microprocessor controlled coffee pot exists Most experimental physicists and indeed experimental scientists in most disciplines study their subject with the aid of apparatus containing significant amounts of electronics and much of that electronics is digital In order to design experiments and apparatus or simply to understand how a piece of equipment works an understanding of electronics has become increasingly important In recognition that electronics has pervaded so many areas courses in digital electronics are now a recommended part of physics and many other science degree courses At the introductory level digital electronics is primarily a practical subject with relatively few basic concepts and any complexity arises from the coupling together of many simple circuits and the extensive use of feedback Designing an electronic circuit and then getting it to work correctly provides an experience and a sense of achievement which is significantly different from

most undergraduate work as it more closely resembles project work than standard laboratory practicals

Practice of Petri Nets in Manufacturing F. Dicesare, George Harhalakis, Jean-Marie Proth, Manuel Silva-Suarez, F. Vernadat, 2012-12-06 M Silva Significant changes have been occurring in industrialized countries since the Second World War Production is moving towards sophisticated high quality products economy of scale has been replaced by economy of scope jerky demands are progressively replacing steady demands and competitiveness is becoming a worldwide phenomenon These trends require highly automated manufacturing systems with small set up times and high flexibility As a consequence implementation and running costs of modern manufacturing systems are drastically increasing whereas their fields of application remain limited and every day become even narrower which increases the risk of early obsolescence This is the reason why designers are trying to improve the preliminary design phase also known as the paper study phase The preliminary design phase includes but is not limited to the functional specification and the evaluation of the system Many tools exist to support the functional specification of manufacturing systems IDEFO is one of these tools It leads using a top down approach to a precise functional description of the required system However its use cannot be extended further In general the evaluation starts with a modeling step which depends on the evaluation tool used and ends by applying the model to find out its main dynamic characteristics Two main approaches can be used to perform this task namely simulation and mathematical approach Using simulation the modeling tool is either a classical computer language or a simulation language

Perspectives of System Informatics Dines Bjørner, Manfred Broy, Igor V. Pottosin, 1996-12-04 This book constitutes the refereed post conference proceedings of the Second International Andrei Ershov Memorial Conference on System Informatics held in Akademgorodok Novosibirsk Russia in June 1996 The 27 revised full papers presented together with 9 invited contributions were thoroughly refereed for inclusion in this volume The book is divided in topical sections on programming methodology artificial intelligence natural language processing machine learning dataflow and concurrency models parallel programming supercompilation partial evaluation object oriented programming semantics and abstract interpretation programming and graphical interfaces and logic programming *The Synthesis Approach to Digital System Design* Petra Michel, Ulrich Lauther, Peter Duzy, 2012-12-06 Over the past decade there has been a dramatic change in the role played by design automation for electronic systems Ten years ago integrated circuit IC designers were content to use the computer for circuit logic and limited amounts of high level simulation as well as for capturing the digitized mask layouts used for IC manufacture The tools were only aids to design the designer could always find a way to implement the chip or board manually if the tools failed or if they did not give acceptable results Today however design technology plays an indispensable role in the design of electronic systems and is critical to achieving time to market cost and performance targets In less than ten years designers have come to rely on automatic or semi automatic CAD systems for the physical design of complex ICs containing over a million transistors In the past three years practical logic synthesis systems that take into account both cost and performance have become a commercial reality and many designers have already relinquished control

of the logic netlist level of design to automatic computer aids. To date only in certain well defined areas especially digital signal processing and telecommunications have higher level design methods and tools found significant success. However the forces of time to market and growing system complexity will demand the broad based adoption of high level automated methods and tools over the next few years.
