The 1090 Megahertz Riddle Junzi Sun, 2021-05-10 In the last twenty years aircraft surveillance has moved from controller based interrogation to automatic broadcast The Automatic Dependent Surveillance Broadcast ADS B is one of the most common methods for aircraft to report their state information like identity position and speed Like other Mode S communications ADS B makes use of the 1090 megahertz transponder to transmit data The protocol for ADS B is open and low cost receivers can easily be used to intercept its signals Many recent air transportation studies have benefited from this open data source

However the current literature does not offer a systematic exploration of Mode S and ADS B data nor does it explain the decoding process This book tackles this missing area in the literature It offers researchers engineers and enthusiasts a clear guide to understanding and making use of open ADS B and Mode S data The first part of this book presents the knowledge required to get started with decoding these signals It includes background information on primary radar secondary radar Mode A C Mode S and ADS B as well as the hardware and software setups necessary to gather radio signals After that the 17 core chapters of the book investigate the details of all types of ADS B signals and commonly used Mode S signals Throughout these chapters examples and sample Python code are used extensively to explain and demonstrate the decoding process Finally the last chapter of the book offers a summary and a brief overview of research topics that go beyond the decoding of these signals
