In Detail

Data analysis is the process of applying logical and analytical reasoning to study each component of data. Python is a multi domain high level programming language. It is often used as a scripting language because of its forgiving syntax and operability with a wide variety of different eco systems. Python has powerful standard libraries or toolkits such as Pylearn2 and Hebel which offers a fast reliable cross platform environment for data analysis. With this book we will get you started with Python data analysis and show you what its advantages are. The book starts by introducing the principles of data analysis and supported libraries along with NumPy basics for statistic and data processing. Next it provides an overview of the Pandas package and uses its powerful features to solve data processing problems. Moving on the book takes you through a brief overview of the Matplotlib API and some common plotting functions for DataFrame such as plot. Next it will teach you to manipulate the time and data structure and load and store data in a file or database using Python packages. The book will also teach you how to apply powerful packages in Python to process raw data into pure and helpful data using examples. Finally the book gives you a brief overview of machine learning algorithms that is applying data analysis results to make decisions or build helpful products such as recommendations and predictions using scikit learn. Style and approach: This is an easy to follow step by step guide to get you familiar with data analysis and the libraries supported by Python. Topics are explained with real world examples wherever required.
