Heads, Jaws, and Muscles Janine M. Ziermann, Raul E. Diaz Jr, Rui Diogo, 2019-01-23 The vertebrate head is the most complex part of the animal body and its diversity in nature reflects a variety of life styles feeding modes and ecological adaptations This book will take you on a journey to discover the origin and diversification of the head which evolved from a seemingly headless chordate ancestor Despite their structural diversity heads develop in a highly conserved fashion in embryos Major sensory organs like the eyes ears nose and brain develop in close association with surrounding tissues such as bones cartilages muscles nerves and blood vessels Ultimately this integrated unit of tissues gives rise to the complex functionality of the musculoskeletal system as a result of sensory and neural feedback most notably in the use of the vertebrate jaws a major vertebrate innovation only lacking in hagfishes and lampreys The cranium subsequently further diversified during the major transition from fishes living in an aquatic environment to tetrapods living mostly on land In this book experts will join forces to integrate for the first time state of the art knowledge on the anatomy development function diversity and evolution of the head and jaws and their muscles within all major groups of extant vertebrates Considerations about and comparisons with fossil taxa including emblematic groups such as the dinosaurs are also provided in this landmark book which will be a leading reference for many years to come

Craniofacial Development, Growth and Evolution Murray Clyde Meikle, 2002 Over the past twenty years craniofacial biology has been revolutionized by major developments in our understanding of the cellular molecular and genetic mechanisms underlying embryonic development Many of these advances have been based on animal models most notably the fruitfly *Drosophila* the chick and the mouse Since these developmental processes have been highly conserved during evolution this information is relevant not only to understanding normal human development but also to understanding how genetic mutations produce particular malformations or inherited diseases This book incorporates these discoveries into traditional morphological description of craniofacial development and in a form accessible to clinicians with an interest in the head and neck book cover

Cranial Placodes and Neural Crest Interactions in Craniofacial Development Jean-Pierre Saint-Jeannet, Lisa Taneyhill, Patrick Blader, 2021-06-16

Mouse Models of Developmental Genetic Disease, 2011-09-06 Approximately three percent of newborn humans have congenital anomalies with significant cosmetic and or functional consequences Much of our ability to understand what has gone awry in these birth defects rests with development of animal models for them the mouse has emerged as the model organism of choice for these studies This volume reviews mouse models of specific developmental genetic diseases including neural tube defects cleft lip and or palate congenital heart disease ciliopathies hereditary deafness

and others to provide conceptual insight into congenital anomalies generally The interplay between clinical observation and murine model systems is expected to yield deep insight into mammalian developmental processes and the emergence of effective preventive and or therapeutic strategies Provides busy clinical and basic science researchers a one stop overview and synthesis of the latest research findings and contemporary thought in the area Allows researchers to compare and contrast disease models and also to learn about what models have been developed for large scale distribution Allows researchers to evaluate basic differences in mouse and human biology and propose alternate pathways and possible gene interactions of the disease
