Self-Stabilizing Systems Ajoy K. Datta, Ted Herman, 2001-01-01

Physical systems which right themselves after being disturbed evoke our curiosity because we want to understand how such systems are able to react to unexpected stimuli The mechanisms are all the more fascinating when systems are composed of small simple units and the ability of the system to self stabilize emerges out of its components Faithful computer simulations of such physical systems exhibit the self stabilizing property but in the realm of computing particularly for distributed systems we have greater ambition We imagine that all manner of software ranging from basic communication protocols to high level applications could enjoy self corrective properties Self stabilizing software offers a unique non traditional approach to the classical problem of transient fault tolerance Many successful instances of modern fault tolerant networks are based on principles of self stabilization Surprisingly the most widely accepted technical definition of a self stabilizing system does not refer to faults it is the property that the system can be started in any initial state possibly an illegal state and yet the system guarantees to behave properly in finite time This and similar definitions break many traditional approaches to program design

in which the programmer by habit makes assumptions about initial conditions The composition of self stabilizing systems initially seen as a daunting challenge has been transformed into a manageable task thanks to an accumulation of discoveries by many investigators search on various topics in self stabilization continues to supply new methods for constructing self stabilizing systems determines limits and applicability of the paradigm of self stabilization and connects self stabilization to related areas of fault tolerance and distributed computing Ad Hoc and Sensor Networks Yi Pan, Yang Xiao, 2006 Abstract

Distributed Systems Sacha Krakowiak, Santosh Shrivastava, 2003-06-26 In 1992 we initiated a research project on large scale distributed computing systems LSDCS It was a collaborative project involving research institutes and universities in Bologna Grenoble Lausanne Lisbon Rennes Rocquencourt Newcastle and Twente The World Wide Web had recently been developed at CERN but its use was not yet as common place as it is today and graphical browsers had yet to be developed It was clear to us and to just about everyone else that LSDCS comprising several thousands to millions of individual computer systems nodes would be coming into existence as a consequence both of technological advances and the demands placed by applications We were excited about the problems of building large distributed systems and felt that serious rethinking of many of the existing computational paradigms algorithms and structuring principles for distributed computing was called for In our research proposal we summarized the problem domain as follows We expect LSDCS to exhibit great diversity of node and communications capability Nodes will range from mobile laptop computers workstations to supercomputers Whereas mobile computers may well have unreliable low bandwidth communications to the rest of the system other parts of the system may well possess high bandwidth communications capability To appreciate the problems posed by the sheer scale of a system comprising thousands of nodes we observe that such systems will be rarely functioning in their entirety
