Carlino, 1995 **By Force of Habit** John Y. Campbell, John H. Cochrane, 1995 We present a consumption based model that explains the procyclical variation of stock prices the long horizon predictability of excess stock returns and the countercyclical variation of stock market volatility Our model has an individual consumption growth driving process and adds a slow moving external habit to the standard power utility function The

latter feature produces cyclical variation in risk aversion and hence in the prices of risky assets Our model also predicts many of the difficulties that beset the standard power utility model including Euler equation rejections no correlation between mean consumption growth and interest rates very high estimates of risk aversion and pricing errors that are larger than those of the static CAPM Our model captures much of the history of stock prices given only consumption data Since our model captures the equity premium it implies that fluctuations have important welfare costs Unlike many habit persistence models our model does not necessarily produce cyclical variation in the risk free interest rate nor does it produce an extremely skewed distribution or negative realizations of the marginal rate of substitution
