

An abstract painting with a complex, layered composition. The background is a deep, textured blue. Overlaid on this are various organic, leaf-like shapes in shades of green, yellow, and brown. Some areas appear to have a more painterly, visible brushstroke texture, while others are smoother. The overall effect is one of depth and complexity, suggesting a natural or perhaps a microscopic world.

Centeno, Gillian Osmond, 2019-03-23 This goes to reference work surveys the current state of knowledge in the field of metal soap related degradation phenomena in art works It contains detailed descriptions and images of the different phenomena and addresses the practical aspects of soap

formation preventive conservation and treatment The occurrence of metal soaps is one of the defining issues in the conservation of painted surfaces and one that presently leaves innumerable open questions It is estimated that around 70% of paintings in museum collections are affected by some form of metal soap related degradation In recent years significant advances have been made in the detection and characterization of these compounds through interdisciplinary approaches including conventional spectroscopy and microscopy as well as emerging synchrotron based techniques This book for the first time captures a panoramic overview of the state of knowledge of metal soaps related to both scientific analysis and implications for conservation and treatment It also critically examines open questions The book is accessible to audiences with varied backgrounds e g conservators students of conservation science while simultaneously presenting the technical details indispensable for academics and researchers active in this field

Advances in Farm Animal Genomic Resources Stéphane Joost, Michael W. Bruford, Ino Curik, Juha Kantanen, Johannes A. Lenstra, Johann Sölkner, Göran Andersson, Philippe V. Baret, Nadine Buys, Jutta Roosen, Michèle Tixier-Boichard, Paolo Ajmone Marsan, 2016-01-28 The history of livestock started with the domestication of their wild ancestors a restricted number of species allowed to be tamed and entered a symbiotic relationship with humans In exchange for food shelter and protection they provided us with meat eggs hides wool and draught power thus contributing considerably to our economic and cultural development Depending on the species domestication took place in different areas and periods After domestication livestock spread over all inhabited regions of the earth accompanying human migrations and becoming also trade objects This required an adaptation to different climates and varying styles of husbandry and resulted in an enormous phenotypic diversity Approximately 200 years ago the situation started to change with the rise of the concept of breed Animals were

selected for the same visible characteristics and crossing with different phenotypes was reduced. This resulted in the formation of different breeds mostly genetically isolated from other populations. A few decades ago, selection pressure was increased again with intensive production focusing on a limited range of types and a subsequent loss of genetic diversity. For short-term economic reasons, farmers have abandoned traditional breeds. As a consequence, during the 20th century at least 28% of farm animal breeds became extinct, rare, or endangered. The situation is alarming in developing countries where native breeds adapted to local environments and diseases are being replaced by industrial breeds. In the most marginal areas, farm animals are considered to be essential for viable land use, and in the developing world, a major pathway out of poverty. Historic documentation from the period before the breed formation is scarce. Thus, reconstruction of the history of livestock populations depends on archaeological, archeozoological, and DNA analysis of extant populations. Scientific research into genetic diversity takes advantage of the rapid advances in molecular genetics. Studies of mitochondrial DNA, microsatellite DNA profiling, and Y chromosomes have revealed details on the process of domestication, the diversity retained by breeds, and on relationships between breeds. However, we only see a small part of the genetic information, and the advent of new technologies is most timely in order to answer many essential questions. High-throughput single nucleotide polymorphism genotyping is about to be available for all major farm animal species. The recent development of sequencing techniques calls for new methods of data management and analysis and for new ideas for the extraction of information. To make sense of this information in practical conditions, integration of geo-environmental and socio-economic data are key elements. The study and management of farm animal genomic resources, FAnGR, is indeed a major multidisciplinary issue. The goal of the present Research Topic was to collect contributions of high scientific quality relevant to biodiversity management and applying new methods to either new genomic and bioinformatics approaches for characterization of FAnGR, to the development of FAnGR conservation methods applied *ex situ* and *in situ* to socio-economic aspects of FAnGR conservation, to transfer of lessons between wildlife and livestock biodiversity conservation, and to the contribution of FAnGR to a transition in agriculture, FAnGR and agro-ecology.
