Logical Modeling of Cellular Processes: From Software Development to Network Dynamics Matteo Barberis, Tomáš Helikar, 2019-08-16 Mathematical models have become invaluable tools for understanding the intricate dynamic behavior of complex biochemical and biological systems Among computational strategies logical modeling has been recently gaining interest as an alternative

approach to address network dynamics Due to its advantages including scalability and independence of kinetic parameters the logical modeling framework is becoming increasingly popular to study the dynamics of highly interconnected systems such as cell cycle progression T cell differentiation and gene regulation Novel tools and standards have been developed to increase the interoperability of logical models which can now be employ to respond a variety of biological questions This Research Topic brings together the most recent and cutting edge approaches in the area of logical modeling including among others novel biological applications software development and model analysis techniques *Teaching Communication across Disciplines for Professional Development, Civic Engagement, and Beyond* Joanna G. Burchfield, April A.

Kedrowicz, 2023-05-22 In *Teaching Communication Across Disciplines for Professional Development Civic Engagement and Beyond* contributors discuss topics inherent in merging communication across disciplines including challenges and opportunities teaching and research communication and student identity future directions and the transformative possibilities of teaching communication across disciplines A cross disciplinary approach provides an avenue for the integration of a broad education that prepares students for global citizenship and civic engagement Ultimately this book argues that positioning communication as a theoretically rich process of social interaction and meaning with attention to rhetorical sensitivity can expand the vision of communication across the disciplines The increased demand for communication expertise opens opportunities for exploration growth community development and cross disciplinary alliances Scholars of communication English and education will find this book of particular interest Thromboinflammation:

Ferreira, Hongming Miao, 2023-04-26 Cell Signaling in Host-Pathogen Interactions: The Host Point of View Diana

Bahia, Abhay Satoskar, Olivier Dussurget, 2018-03-23 The ability of pathogens such as parasites bacteria fungi and viruses to

invade persist and adapt in both invertebrate and vertebrate hosts is multifactorial and depends on both pathogen and host fitness. Communication between a pathogen and its host relies on a wide and dynamic array of molecular interactions. Through this constant communication, most pathogens evolved to be relatively benign, whereas killing of its host by a pathogen represents a failure to adapt. Pathogens are lethal to their host when their interaction has not been long enough for adaptation. Evolution has selected conserved immune receptors that recognize signature patterns of pathogens as non self elements and initiate host innate responses aimed at eradicating infection. Conversely, pathogens evolved mechanisms to evade immune recognition and subvert cytokine secretion in order to survive, replicate and cause disease. The cell signaling machinery is a critical component of the immune system that relays information from the receptors to the nucleus where transcription of key immune genes is activated. Host cells have developed signal transduction systems to maintain homeostasis with pathogens. Most cellular processes and cell signaling pathways are tightly regulated by protein phosphorylation in which protein kinases are key protagonists. Pathogens have developed multiple mechanisms to subvert important signal transduction pathways such as the mitogen activated protein kinase MAPK and the nuclear factor κ B (NF κ B) pathways. Pathogens also secrete effectors that manipulate actin cytoskeleton and its regulators, hijack cell cycle machinery and alter vesicular trafficking. This research topic focuses on the cellular signaling mechanisms that are essential for host immunity and their subversion by pathogens.

Chemokines and Chemokine Receptors in Brain Homeostasis Flavia Trettel, Richard M. Ransohoff, 2015-08-17. Virtually involved in all pathologies that present an inflammatory component, it is now evident that in the central nervous system, chemokines and chemokine receptors possess pleiotropic properties beyond chemotaxis. Constitutive brain expression of chemokines and their receptors on endothelial cells but also on neurons and glia suggests a role for such molecules in mediating homeostatic cross talk between cells of the brain parenchyma. Cross talk between neurons and glia is determinant to the establishment and maintenance of a brain environment that ensures normal function and in particular, glial cells are active players that respond to environmental changes and act for the survival, growth, differentiation and repair of the nervous tissue. In this regard, brain endogenous chemokines represent key molecules that play a role in brain development, neurogenesis, neurotransmission and neuroprotection. As important regulators of peripheral immune response, chemokines are molecules of the immune system that play a central role in coordinating communication between the nervous and the immune systems in the context of infections and brain injury. Indeed, in pathological processes resulting from infections, brain trauma, ischemia and chronic neurodegenerative diseases, chemokines represent important neuroinflammatory mediators that drive leucocytes trafficking into the central nervous system, facilitating an immune response by targeting cells of the innate and adaptive immune system. The third edition of the international conference Chemokines and Chemokine Receptors in the Nervous System, held in Rome in October 2013, represented an exciting platform to promote discussion among researchers in different disciplines to understand the role of chemokines in brain

homeostasis This Frontiers Research Topic arises from this conference and wants to be an opportunity to further discuss and highlight the importance of brain chemokines as key molecules that not only grant the interplay between the immune and the nervous systems but in addition drive modulatory functions on brain homeostasis orchestrating neurons microglia and astrocytes communication
