

FOOD STAMPS AND OBESITY

What We Know and What It Means

Michele Ver Ploeg, sverploeg@ers.usda.gov
Katherine Ralston, kralston@ers.usda.gov

Critics of the Food Stamp Program point to higher rates of obesity among some low-income populations and question whether the program might have been too successful in boosting food consumption. They assert that giving assistance in the form of benefits redeemable for food, instead of cash, has led participants to spend more on food and eat more than they would have otherwise. Others wonder if the monthly issuance of food stamp benefits is linked to boom-and-bust cycles of consumption that could lead to weight gain over the long term.

A recent ERS report explores whether there is any evidence of a causal link between food stamp participation and obesity. ERS reviewed and synthesized the growing and sometimes conflicting research on the issue. Researchers placed greater weight on studies that used statistical methods to control for the fact that people choose to participate in the program and those who

- Food Stamp Program participation does not increase the likelihood of being overweight or obese for men or children.
- Women are the only group for which multiple studies show a potential link between food stamp participation and body weight.
- Devising policy changes for household members who may be at risk of gaining weight, without harming those who are not but still need food assistance, is a difficult challenge.

participate are likely to be different from those who do not in ways that researchers cannot always observe. These differences could be related to body weight.

The weight of evidence from these studies indicates that for most program participants, food stamp benefits

do not increase either Body Mass Index (BMI)—a measure of weight adjusted for height—or the likelihood of being obese. A review of the research indicates that food stamp benefits do not increase the likelihood of being overweight or obese for men or children. For nonelderly adult women, who account for 28 percent of all food stamp participants, multiple studies show a potential link between food stamp receipt and an increase in obesity and BMI, although this effect appears to be small—about 3 pounds for a woman 5'4" to 5'6" tall. Some studies found that long-term participation in the program appears to heighten the impact on obesity.
