A Tale of Seven Scientists and a New Philosophy of Science Eric Scerri, 2016-10-10 In his latest book Eric Scerri presents a completely original account of the nature of scientific progress It consists of a holistic and unified approach in which science is seen as a living and evolving single organism Instead of scientific revolutions featuring exceptionally gifted individuals Scerri argues that the little people contribute as much as the heroes of science To do this he examines seven case studies of virtually unknown chemists and physicists in the early 20th century quest to discover the structure of the atom They include the amateur scientist Anton van den Broek who pioneered the notion of atomic number as well as Edmund Stoner a then physics graduate student who provided the seed for Pauli's Exclusion Principle Another case is the physicist John Nicholson who is virtually unknown and yet was the first to propose the notion of quantization of angular momentum that was soon put to good use by Niels Bohr Instead of focusing on the logic and rationality of science Scerri elevates the role of trial and error and multiple discovery and moves beyond the notion of scientific developments being right or wrong While criticizing Thomas Kuhn's notion of scientific revolutions he agrees with Kuhn that science is not drawn towards an external truth but is rather driven from within The book will enliven the long standing debate on the nature of science which has increasingly shied away from the big question of what is science

Mereology and the Sciences Claudio Calosi, Pierluigi Graziani, 2014-06-02 This volume is the first systematic and thorough attempt to investigate the relation and the possible applications of mereology to contemporary science It gathers contributions from leading scholars in the field and covers a wide range of scientific theories and practices such as physics mathematics chemistry biology computer science and engineering Throughout the volume a variety of foundational issues are investigated both from the formal and the empirical point of view The first section looks at the topic as it applies to physics The section addresses questions of persistence and composition within quantum and relativistic physics and concludes by scrutinizing the possibility to capture continuity of motion as described by our best physical theories within gunky space times The second part tackles mathematics and shows how to provide a foundation for point free geometry of space switching to fuzzy logic The relation between mereological sums and set theoretic suprema is investigated and issues about different mereological perspectives such as classical and natural Mereology are thoroughly discussed The third section in the volume looks at natural science Several questions from biology medicine and chemistry are investigated From the perspective of biology there is an attempt to provide axioms for inferring statements about part hood

between two biological entities from statements about their spatial relation From the perspective of chemistry it is argued that classical mereological frameworks are not adequate to capture the practices of chemistry in that they consider neither temporal nor modal parameters The final part introduces computer science and engineering A new formal mereological framework in which an indeterminate relation of part hood is taken as a primitive notion is constructed and then applied to a wide variety of disciplines from robotics to knowledge engineering A formal framework for discrete mereotopology and its applications is developed and finally the importance of mereology for the relatively new science of domain engineering is also discussed
