## **Foundations Of Macroecology Classic Papers With Commentaries:**

*Foundations of Macroecology* Felisa A. Smith, John L. Gittleman, James H. Brown, 2014-08-22 Macroecology is an approach to science that emphasizes description and explanation of patterns and processes at large spatial and temporal scales. Some liken it to seeing the forest through the trees, an apt ecological use of the proverbial phrase. The term itself was introduced to modern literature by our authors James Brown and Brian Maurer in a seminal science paper in 1989. We then published books by both of these authors including Brown's *Macroecology* in 1995 which quickly traveled to the shelf of classics in ecology, credited with cohering and inspiring a subfield of ecology proper. While macroecology is to many a modern subfield, the large scale perspective it advocates is implicit in earlier publications. For example, in 1898 de Liocourt studied the influence of management practices on the structure of French fir forests and characterized the distribution of tree size in three different stands. His findings that in natural areas the number of trees declined exponentially with increasing diameter of the trunk allowed him to draw conclusions about the influence of management practices on tree distribution patterns. Similarly, other classic macroecological patterns including the species area relationship, latitudinal gradient of species richness, relationship between body size and metabolic rate, species abundance distribution, and species body size distribution were identified decades, sometimes even centuries ago. Consequently, despite the scant twenty years that has elapsed since the term was coined, macroecology has a deep and rich history. *Foundations of Macroecology* traces and coheres that history, charting an evolutionary trajectory to the rigorous macroecological research landscape science enjoys today. The forty-six papers span eight decades from 1920 to 1998 and include divergent perspectives of space, time, and taxonomic and habitat affiliation. They are organized into two main parts: *Macroecology before Macroecology* and *Dimensions of Macroecology*. The latter is further subdivided into six sections reflecting the subject matter: Allometry and Body Size, Evolutionary Dynamics, Abundance and Distributions, Species Diversity, and Methodological Advances. For each reprinted paper, a macroecologist specializing in that area has written original commentary that places the paper in a broader context and explains why it is foundational.

**Mangrove Ecosystems: A Global Biogeographic Perspective** Victor H. Rivera-Monroy, Shing Yip Lee, Erik Kristensen, Robert R. Twilley, 2017-11-03 This book presents a comprehensive overview and analysis of mangrove ecological processes, structure, and function at the local, biogeographic, and global scales, and how these properties interact to provide key ecosystem services to society. The analysis is based on an international collaborative effort that focuses on regions and countries holding the largest mangrove resources and encompasses the major biogeographic and socio-economic settings of mangrove distribution. Given the economic and ecological importance of mangrove wetlands at the global scale, the chapters aim to integrate ecological and socio-economic perspectives on mangrove function and management using a system-level hierarchical analysis framework. The book explores the nexus between mangrove ecology and the capacity for ecosystem services, with an emphasis on thresholds, multiple stressors, and local conditions that determine this capacity. The

interdisciplinary approach and illustrative study cases included in the book will provide valuable resources in data information and knowledge about the current status of one of the most productive coastal ecosystem in the world

Biogeography C. Barry Cox, Richard J. Ladle, Peter D. Moore, 2020-01-07 Through nine successful editions and for over 45 years *Biogeography: An Ecological and Evolutionary Approach* has provided a thorough and comprehensive exploration of the varied scientific disciplines and research that are essential to understanding the subject. The text noted for its clear and engaging style of writing has been praised for its solid background in historical biogeography and basic biology that is enhanced and illuminated by discussions of current research. This new edition incorporates the exciting changes of the recent years and presents a thoughtful exploration of the research and controversies that have transformed our understanding of the biogeography of the world. New themes and topics in this tenth edition include Next generation genetic technologies and their use in historical biogeography, phylogeography and population genomics, Biogeographical databases and biodiversity information systems which are becoming increasingly important for biogeographical research, An introduction to functional biogeography and its applications to community assembly, diversity gradients and the analysis of ecosystem functioning, Updated case studies focusing on island biogeography using the latest phylogenetic studies. *Biogeography: An Ecological and Evolutionary Approach* reveals how the patterns of life that we see today have been created by the two great Engines of the Planet: the Geological Engine, plate tectonics which alters the conditions of life on the planet and the Biological Engine, evolution which responds to these changes by creating new forms and patterns of life.

**Nonadaptive Selection** John Damuth, Lev R. Ginzburg, 2025-07-10 The first comprehensive explanation of a widely applicable but underappreciated mechanism of evolution operating at higher levels of organization than the individual. In this important treatise ecologists and evolutionary biologists John Damuth and Lev R. Ginzburg identify a specific evolutionary process in biology which they call nonadaptive selection. The idea is simple but the implications are profound. Nonadaptive selection as they use the term is selection among biological entities as is natural selection but is based on the fitness effects of structural properties intrinsic to the entities under selection rather than on interactions between traits and a local shared environment. In other words features of systems that evolve by nonadaptive selection do not adapt to local environmental conditions rather this selective process increases the long term stability of the focal systems independent of local conditions. Nonadaptive selection may be of particular value in explaining broad persistent patterns in multispecies biological units where adaptive evolution may be weak or poorly defined. Examples include Damuth's Law, the equivalence of energy use among animal species across a wide range of body sizes, the ratio dependent or Arditi-Ginzburg predation conjecture, the consistency of allometric scaling powers, the shortness of trophic chains and the prevalence of certain types of three species trophic structures across ecosystems. Damuth and Ginzburg see nonadaptive selection underlying patterns of ecological allometries, community structure and species interactions with some implications for macroevolution. Moreover they find a surprising relationship between these

nonadaptive processes and biological laws They do not advocate the reorientation of any existing research programs but present nonadaptive selection as an additional conceptual framework that may be useful to add to ecology and evolution

**Ecology** Michael Begon,Colin R. Townsend,2020-11-11 A definitive guide to the depth and breadth of the ecological sciences revised and updated The revised and updated fifth edition of Ecology From Individuals to Ecosystems now in full colour offers students and practitioners a review of the ecological sciences The previous editions of this book earned the authors the prestigious Exceptional Life time Achievement Award of the British Ecological Society the aim for the fifth edition is not only to maintain standards but indeed to enhance its coverage of Ecology In the first edition 34 years ago it seemed acceptable for ecologists to hold a comfortable objective not to say aloof position from which the ecological communities around us were simply material for which we sought a scientific understanding Now we must accept the immediacy of the many environmental problems that threaten us and the responsibility of ecologists to play their full part in addressing these problems This fifth edition addresses this challenge with several chapters devoted entirely to applied topics and examples of how ecological principles have been applied to problems facing us highlighted throughout the remaining nineteen chapters Nonetheless the authors remain wedded to the belief that environmental action can only ever be as sound as the ecological principles on which it is based Hence while trying harder than ever to help improve preparedness for addressing the environmental problems of the years ahead the book remains in its essence an exposition of the science of ecology This new edition incorporates the results from more than a thousand recent studies into a fully up to date text Written for students of ecology researchers and practitioners the fifth edition of Ecology From Individuals to Ecosystems is an essential reference to all aspects of ecology and addresses environmental problems of the future

*Foundations of Biogeography* Mark V. Lomolino,Dov F. Sax,James H. Brown,2004-07 Foundations of Biogeography provides facsimile reprints of seventy two works that have proven fundamental to the development of the field From classics by Georges Louis LeClerc Comte de Buffon Alexander von Humboldt and Charles Darwin to equally seminal contributions by Ernst Mayr Robert MacArthur and E O Wilson these papers and book excerpts not only reveal biogeography s historical roots but also trace its theoretical and empirical development Selected and introduced by leading biogeographers the articles cover a wide variety of taxonomic groups habitat types and geographic regions Foundations of Biogeography will be an ideal introduction to the field for beginning students and an essential reference for established scholars of biogeography ecology and evolution

**Dynamique et évolution de la biodiversité et des écosystèmes** Tatiana Giraud,2022-09-28 Pour pr server

la biodiversité et les nombreux services qu'elle nous rend nous devons comprendre comment elle s'est formée et quels sont les facteurs jouant sur sa dynamique. La théorie de l'évolution par sélection naturelle offre un paradigme très puissant pour expliquer pourquoi le monde vivant est tel qu'il est, comment la biodiversité se forme, quelle est sa dynamique et enfin comment les populations arrivent à adapter ou non un environnement changeant. Face à la menace du changement climatique et au déclin rapide de la biodiversité qu'elle entraîne, les sciences de l'écologie et de l'évolution sont essentielles pour mesurer l'ampleur de la crise actuelle et ses conséquences sur les sociétés humaines.

Tatiana Giraud est directrice de recherche au CNRS Unité écologie systématique et évolution Université Paris Saclay CNRS AgroParisTech et membre de l'Académie des sciences. Elle est professeure invitée au Collège de France sur la chaire annuelle Biodiversité et écosystèmes créée en partenariat avec la fondation Jean François et Marie Laure de Clermont Tonnerre pour l'année académique 2021-2022.

**Ecologia** Begon, Michael, Townsend, Colin R., 2023-02-13. Abrangente e aprofundado. Ecologia de indivíduos a ecossistemas o livro texto definitivo sobre as ciências ecológicas. Revisada, atualizada, ampliada e totalmente em cores. Esta 5ª edição continua a oferecer em sua essência uma exposição da ciência da ecologia. Para isso, trata da distribuição e abundância dos organismos vivos, além das características físicas, químicas e especialmente das biológicas, bem como das interações que determinam a ocorrência e a quantidade desses organismos. A obra traz ainda exemplos práticos e em meros exemplos de como os princípios ecológicos se aplicam ao estudo dos problemas ambientais em diferentes escalas.

**Conservation Biogeography** Richard J. Ladle, Robert J. Whittaker, 2011-01-11. CONSERVATION BIOGEOGRAPHY. The Earth's ecosystems are in the midst of an unprecedented period of change as a result of human action. Many habitats have been completely destroyed or divided into tiny fragments; others have been transformed through the introduction of new species or the extinction of native plants and animals while anthropogenic climate change now threatens to completely redraw the geographic map of life on this planet. The urgent need to understand and prescribe solutions to this complicated and interlinked set of pressing conservation issues has led to the transformation of the venerable academic discipline of biogeography, the study of the geographic distribution of animals and plants. The newly emerged sub-discipline of conservation biogeography uses the conceptual tools and methods of biogeography to address real-world conservation problems and to provide predictions about the fate of key species and ecosystems over the next century. This book provides the first comprehensive review of the field in a series of closely interlinked chapters addressing the central issues within this exciting and important subject.

**Revista de biología tropical**, 1998. *Foundations of Ecology* Leslie A. Real, James H. Brown, 1991-10-15. Assembled here for the first time in one volume are forty classic papers that have laid the foundations of modern ecology. Whether by posing new problems, demonstrating important effects or stimulating new research, these papers have made substantial contributions to an understanding of ecological processes and they continue to influence the field today. The papers span nearly nine decades of ecological research from 1887 on and are organized in six sections: foundational papers, theoretical advances, synthetic

statements methodological developments field studies and ecological experiments Selections range from Connell s elegant account of experiments with barnacles to Watt s encyclopedic natural history from a visionary exposition by Grinnell of the concept of niche to a seminal essay by Hutchinson on diversity Six original essays by contemporary ecologists and a historian of ecology place the selections in context and discuss their continued relevance to current research This combination of classic papers and fresh commentaries makes *Foundations of Ecology* both a convenient reference to papers often cited today and an essential guide to the intellectual and conceptual roots of the field Published with the Ecological Society of America
