- Die Technologie der neuen OCT-Angiographie (OCT-A), die im Gegensatz zur Fluoreszein-Angiographie (FAG) eine Darstellung der Gefäße erlaubt, ohne zuvor dem Patienten einen Farbstoff zu injizieren, macht schnelle Fortschritte und hat das Potential in kommenden Jahren die FAG zu ersetzen

Hurvich,2012-12-06 This volume on Visual Psychophysics documents the current status of research aimed toward understanding the intricacies of the visual mechanism and its laws of operation in intact human perceivers As can be seen from the list of contributors the problems of vision engage the interest and experimental ingenuity of investigators from a variety of disciplines Thus we find authors affiliated with departments of biology medical and physiological physics ophthalmology physics physiology and anatomy psychology laboratories of neurophysiology medical clinics schools of optometry visual and other types of research institutes A continuing interplay between psychophysical studies and physiological work is everywhere evident As more information about the physiological basis of vision accumulates and new studies and analyses of receptor photochemistry and the neurophysiology of retina and brain appear psychophysical studies of the intact organism become more sharply focused sometimes more complex and often more specialized Technological advances have increased the variety and precision of the stimulus controls and advances in measurement techniques have reopened old problems and stimulated the investigation of new ones In some cases new concepts are being drawn in to help further our understanding of the laws by which the visual mechanism operates in other cases ideas enunciated long ago have been reevaluated developed more fully and reified in

terms of converging evidence from both psychophysical experiments and unit recordings from visual cells Heredity and Visual Development Joel B. Sheffield, S. Robert Hilfer, 2012-12-06 The eye has fascinated scientists from the earliest days of biological investigation. The diversity of its parts and the precision of their interaction make it a favorite model system for a variety of developmental studies. The eye is a particularly valuable experimental system not only because its tissues provide examples of fundamental processes but also because it is a prominent and easily accessible structure at very early embryonic ages. In order to provide an open forum for investigators working on all aspects of ocular development, a series of symposia on ocular and visual development was initiated in 1973. A major objective of the symposia has been to foster communication between the basic research worker and the clinician. It is our feeling that much can be learned on both sides from community interaction. The idea for an informal meeting allowing maximum exchange of ideas originated with Dr Leon Candau, who supplied the necessary driving force that made the series a reality. Each symposium has on a different aspect of ocular development. Speakers have been selected to approach related topics from different perspectives. Fourth International Visual Field Symposium Bristol, April 13-16, 1980 E.L. Greve, G. Verriest, 2012-12-06 The 4th International Visual Field Symposium of the International Perimetric Society was held on the 13-16 April 1980 in Bristol, England, at the occasion of the 6th Congress of the European Society of Ophthalmology. The main themes of the symposium were comparison of classical perimetry with visual evoked response, comparison of classical perimetry with special psychophysical methods and optic nerve pathology. Understandably, many papers dealt with computer-assisted perimetry. This rapidly developing subgroup of perimetry may radically change the future of our method of examination. New instruments were introduced, new and exciting software was proposed, and the results of comparative investigations reported. There have been many confusing statements in the literature on the relative value of perimetry and the registration of visual evoked responses. Several reports attempted to bring some clarity in this issue. There is reason for further comparative research. A number of papers dealt with special psychophysical methods, i.e. methods not using the simple monocular differential threshold. The old critical fusion frequency received new attention. Fundusperimetry was used for testing spatial summation. Acuity perimetry, binocular perimetry, etc. showed that there exist many possibilities for examining visual function. At present, it is not clear to us what exactly the place of these methods is in our diagnostic armament. However, it is quite clear that some of them are promising and may lead to a further differentiation of perimetric methods. Ionisierende Strahlen in der Augenheilkunde W. Jaeger, 2013-10-05 Abhandlungen Aus Der Augenheilkunde und Ihren Grenzgebieten, 1963 *Neurogenetics and Neuro-Ophthalmology, 5th International Congress, Nijmegen, The Netherlands, 8-10 September, 1977* A.F. These filters are neither entirely neutral nor completely uniform, but these

variations are not significant for perimetry The maximum luminance of the stimuli is standardized at 1000 asb 316 2 cd m The standard GP for kinetic perimetry has 3 neutral density filters which reduce the luminance by 0 5 1 0 and 1 5 log units respectively The modification of the GP for static perimetry is supplied with an additional series of four neutral density filters which allow luminance steps of 0 1 0 2 0 3 and 0 4 log units The resulting luminance values expressed in apostilb are given in Table I
