Enumerative Geometry And String Theory:

Enumerative Geometry and String Theory Sheldon Katz, 2006 Perhaps the most famous example of how ideas from modern physics have revolutionized mathematics is the way string theory has led to an overhaul of enumerative geometry an area of mathematics that started in the eighteenth century old problems of enumerating geometric configurations have now been solved using new and deep mathematical techniques inspired by physics The book begins with an insightful introduction to enumerative geometry From there the goal becomes explaining the more advanced elements of enumerative algebraic geometry Along the way there are some crash courses on intermediate topics which are essential tools for the student of modern mathematics such as cohomology and other topics in geometry The physics content assumes nothing beyond a first undergraduate course The focus is on explaining the action principle in physics the idea of string theory and how these directly lead to questions in geometry Once these topics are in place the connection between physics and enumerative geometry is made with the introduction of topological quantum field theory and quantum cohomology

Enumerative Invariants in Algebraic Geometry and String Theory Marcos Marino, Michael Thaddeus, Ravi Vakil, 2008-08-15 Starting in the middle of the 80s there has been a growing and fruitful interaction between algebraic geometry and certain areas of theoretical high energy physics especially the various versions of string theory Physical heuristics have provided inspiration for new mathematical definitions such as that of Gromov Witten invariants leading in turn to the solution of problems in enumerative geometry Conversely the availability of mathematically rigorous definitions and theorems has benefited the physics research by providing the required evidence in fields where experimental testing seems problematic The aim of this volume a result of the CIME Summer School held in Cetraro Italy in 2005 is to cover part of the most recent and interesting findings in this subject **Enumerative Invariants in Algebraic Geometry and String Theory** Marcos Marino, Michael Thaddeus, Ravi Vakil, 2009-08-29 Starting in the middle of the 80s there has been a growing and fruitful interaction between algebraic geometry and certain areas of theoretical high energy physics especially the various versions of string theory Physical heuristics have provided inspiration for new mathematical definitions such as that of Gromov Witten invariants leading in turn to the solution of problems in enumerative geometry Conversely the availability of mathematically rigorous definitions and theorems has benefited the physics research by providing the required evidence in fields where experimental testing seems problematic The aim of this volume a result of the CIME Summer School held in Cetraro Italy in 2005 is to cover part of the most recent and interesting findings in this subject **Topological String Theory and Enumerative Geometry** Yun S. Chern-Simons Theory, Matrix Models, and Topological

Strings Marcos Marino, 2005-09-22 In recent years the old idea that gauge theories and string theories are equivalent has been implemented and developed in various ways and there are by now various models where the string theory gauge theory correspondence is at work One of the most important examples of this correspondence relates Chern Simons theory a topological gauge theory in three dimensions which describes knot and three manifold invariants to topological string theory which is deeply related to Gromov Witten invariants This has led to some surprising relations between three manifold geometry and enumerative geometry This book gives the first coherent presentation of this and other related topics After an introduction to matrix models and Chern Simons theory the book describes in detail the topological string theories that correspond to these gauge theories and develops the mathematical implications of this duality for the enumerative geometry of Calabi Yau manifolds and knot theory It is written in a pedagogical style and will be useful reading for graduate students and researchers in both mathematics and physics willing to learn about these developments

Topological String Theory and Enumerative Geometry, 2003 In this thesis we investigate several problems which have their roots in both topological string theory and enumerative geometry In the former case underlying theories are topological field theories whereas the latter case is concerned with intersection theories on moduli spaces A permeating theme in this thesis is to examine the close interplay between these two complementary fields of study The main problems addressed are as follows In considering the Hurwitz enumeration problem of branched covers of compact connected Riemann surfaces we completely solve the problem in the case of simple Hurwitz numbers In addition utilizing the connection between Hurwitz numbers and Hodge integrals we derive a generating function for the latter on the moduli space $\bar{M}_{g,2}$ of 2 pointed genus g Deligne Mumford stable curves We also investigate Givental's recent conjecture regarding semisimple Frobenius structures and Gromov Witten invariants both of which are closely related to topological field theories we consider the case of a complex projective line P^1 as a specific example and verify his conjecture at low genera In the last chapter we demonstrate that certain topological open string amplitudes can be computed via relative stable morphisms in the algebraic category

Lectures on Fractal

Geometry and Dynamical Systems Ya. B. Pesin, Vaughn Climenhaga, 2009 Both fractal geometry and dynamical systems have a long history of development and have provided fertile ground for many great mathematicians and much deep and important mathematics. These two areas interact with each other and with the theory of chaos in a fundamental way: many dynamical systems, even some very simple ones, produce fractal sets which are in turn a source of irregular chaotic motions in the system. This book is an introduction to these two fields with an emphasis on the relationship between them. The first half of the book introduces some of the key ideas in fractal geometry and dimension theory: Cantor sets, Hausdorff dimension, box dimension, using dynamical notions whenever possible, particularly one-dimensional Markov maps and symbolic dynamics. Various techniques for computing Hausdorff dimension are shown, leading to a discussion of Bernoulli and Markov measures and of the relationship between dimension, entropy, and Lyapunov exponents. In the second half of the book, some examples of dynamical systems are considered and various phenomena of chaotic behaviour are discussed, including bifurcations, hyperbolicity, attractors, horseshoes, and intermittent and persistent chaos. These phenomena are naturally revealed in the course of our study of two real models from science: the FitzHugh-Nagumo model and the Lorenz system of differential equations. This book is accessible to undergraduate students and requires only standard knowledge in calculus, linear algebra, and differential equations. Elements of point set topology and measure theory are introduced as needed. This book is a result of the MASS course in analysis at Penn State University in the fall semester of 2008. Nam-Gyu Kang, Jaigyoung Choe, Kyeongsu Choi, Sang-hyun Kim, 2022-09-30 This book consists of five chapters presenting problems of current research in mathematics with its history and development, current state, and possible future direction. Four of the chapters are expository in nature, while one is based more directly on research. All deal with important areas of mathematics, however, such as algebraic geometry, topology, partial differential equations, Riemannian geometry, and harmonic analysis. This book is addressed to researchers who are interested in those subject areas.

Young Hoon Kiem discusses classical enumerative geometry before string theory and improvements after string theory, as well as some recent advances in quantum singularity theory. Donaldson-Thomas theory for Calabi-Yau 4-folds and Vafa-Witten invariants. Dongho Chae discusses the finite time singularity problem for three-dimensional incompressible Euler equations. He presents Kato's classical local well-posedness results, Beale-Kato-Majda's blow-up criterion, and recent studies on the singularity problem for the 2D Boussinesq equations. Simon Brendle discusses recent developments that have led to a complete classification of all the singularity models in a three-dimensional Riemannian manifold. He gives an alternative proof of the classification of noncollapsed steady gradient Ricci solitons in dimension 3. Hyeonbae Kang reviews some of the developments in the Neumann-Poincaré operator (NPO). His topics include visibility and invisibility via polarization tensors, the decay rate of eigenvalues, and surface localization of plasmon singular geometry and the essential spectrum analysis of stress and the structure of the elastic NPO. Danny Calegari provides an explicit description of the shift locus as a complex of spaces over a

contractible building He describes the pieces in terms of dynamically extended laminations and of certain explicit discriminant like affine algebraic varieties

The Calabi-Yau Landscape Yang-Hui He, 2021-07-31 Can artificial intelligence learn mathematics The question is at the heart of this original monograph bringing together theoretical physics modern geometry and data science The study of Calabi Yau manifolds lies at an exciting intersection between physics and mathematics Recently there has been much activity in applying machine learning to solve otherwise intractable problems to conjecture new formulae or to understand the underlying structure of mathematics In this book insights from string and quantum field theory are combined with powerful techniques from complex and algebraic geometry then translated into algorithms with the ultimate aim of deriving new information about Calabi Yau manifolds While the motivation comes from mathematical physics the techniques are purely mathematical and the theme is that of explicit calculations The reader is guided through the theory and provided with explicit computer code in standard software such as SageMath Python and Mathematica to gain hands on experience in applications of artificial intelligence to geometry Driven by data and written in an informal style The Calabi Yau Landscape makes cutting edge topics in mathematical physics geometry and machine learning readily accessible to graduate students and beyond The overriding ambition is to introduce some modern mathematics to the physicist some modern physics to the mathematician and machine learning to both

Introduction to String Theory Sergio Cecotti, 2023-10-06 Graduate students typically enter into courses on string theory having little to no familiarity with the mathematical background so crucial to the discipline As such this book based on lecture notes edited and expanded from the graduate course taught by the author at SISSA and BIMSA places particular emphasis on said mathematical background The target audience for the book includes students of both

theoretical physics and mathematics This explains the book's strange style on the one hand it is highly didactic and explicit with a host of examples for the physicists but in addition there are also almost 100 separate technical boxes appendices and starred sections in which matters discussed in the main text are put into a broader mathematical perspective while deeper and more rigorous points of view particularly those from the modern era are presented The boxes also serve to further shore up the reader's understanding of the underlying math In writing this book the author's goal was not to achieve any sort of definitive conciseness opting instead for clarity and completeness To this end several arguments are presented more than once from different viewpoints and in varying contexts
