Introduction

The Elements of Statistical Learning is an influential and widely studied book in the fields of machine learning, statistical inference, and pattern recognition. It is a standard recommended text in many graduate courses on these topics. It is also very challenging, particularly if one faces it without the support of teachers who are expert in the subject matter. For various reasons, both authors of these notes felt the need to understand the book well, and therefore to produce notes on the text when we found the text difficult at first reading, and answers to the exercises. Gaining understanding is time-consuming and intellectually demanding, so it seemed sensible to record our efforts in LaTeX, and make it available on the web to other readers. A valuable by-product of writing up mathematical material, is that often one finds gaps and errors in what one has written.

Now it is well-known in all branches of learning, but in particular in *mathematical* learning, that the way to learn is to *do*, rather than to *read*. It is all too common to read through some material, convince oneself that one understands it well, but then find oneself at sea when trying to apply it in even a slightly different situation. Moreover, material understood only at a shallow level is easily forgotten.

It is therefore our *strong* recommendation that readers of the book should not look at our responses to any of the exercises before making a substantial effort to understand it without this aid. Any time spent in this way, even if it ends without success, will make our solutions

Data Analytics Shuai

Huang,Houtao Deng,2021-04-16 Data Analytics A Small Data Approach is suitable for an introductory data analytics course to help students understand some main statistical learning models It has many small datasets to guide students to work out pencil solutions of the models and then compare with results obtained from established R packages Also as data science practice is a process that should be told as a story in this book there are many course materials about exploratory data analysis residual analysis and flowcharts to develop and validate models and data pipelines The main models covered in this book include linear regression logistic regression tree models and random forests ensemble learning sparse learning principal component analysis kernel methods including the support vector machine and kernel regression and deep learning Each chapter introduces two or three techniques For each technique the book highlights the intuition and rationale first then shows how mathematics is used to articulate the intuition and formulate the learning problem R is used to implement the techniques on both simulated and real world dataset Python code is also available at the book s website <http://dataanalyticsbook.info>
