Geotechnical Engineering for the Preservation of Monuments and Historic Sites III Renato Lancellotta, Carlo Viggiani, Alessandro Flora, Filomena de Silva, Lucia Mele, 2022-06-14 This book contains the invited lectures presented at the 3th International Symposium on Geotechnical Engineering for the Preservation of Monuments and Historic Sites IS NAPOLI 2022 Naples Italy 22-24 June 2022. It collects the opening address, the third Kerisel Lecture, four keynote lectures and eleven panel lectures and provides a broad impression of 1) the current state of knowledge and 2) the techniques used worldwide for the preservation of built heritage. When confronted with structures relevant to local and global history, there is only one way to select the best possible conservation solution: the multidisciplinary approach. Therefore, the invited speakers have been selected with different pertinent skills to represent this complexity from the points of view of geotechnical engineers, structural engineers, architects and conservation experts. The book will be useful to researchers, practitioners, administrations and all those working or interested in the preservation of built heritage.

Geostatistical and Geospatial Approaches for the Characterization of Natural Resources in the Environment N. Janardhana Raju, 2015-11-30. These proceedings of the IAMG 2014 conference in New Delhi explore the current state of the art and inform readers about the latest geostatistical and space-based technologies for assessment and management in the contexts of natural resource exploration, environmental pollution hazards and natural disaster research. The proceedings cover 3D visualization, time series analysis, environmental geochemistry, numerical solutions in hydrology and hydrogeology, geotechnical engineering, multivariate geostatistics, disaster management, fractal modeling, petroleum exploration, geoinformatics, sedimentary basin analysis, spatiotemporal modeling, digital rock geophysics, advanced mining assessment and glacial studies and range from the laboratory to integrated field studies. Mathematics plays a key part in the crust, mantle, oceans and atmosphere, creating climates that cause natural disasters and influencing fundamental aspects of life supporting

systems and many other geological processes affecting Planet Earth. As such, it is essential to understand the synergy between the classical geosciences and mathematics which can provide the methodological tools needed to tackle complex problems in modern geosciences. The development of science and technology transforming from a descriptive stage to a more quantitative stage involves qualitative interpretations such as conceptual models that are complemented by quantification, e.g. numerical models, fast dynamic geologic models, deterministic and stochastic models. Due to the increasing complexity of the problems faced by today's geoscientists, joint efforts to establish new conceptual and numerical models and develop new paradigms are called for.

Rock Mechanics: Achievements and Ambitions Meifeng Cai, 2011-09-22. *Rock Mechanics Achievements and Ambitions* contains the papers accepted for the 2nd ISRM International Young Scholars Symposium on Rock Mechanics which was sponsored by the ISRM and held on 14-16 October 2011 in Beijing, China, immediately preceding the 12th ISRM Congress on Rock Mechanics. Highlighting the work of young teachers, researchers, and practitioners, the present work provides an important stimulus for the next generation of rock engineers because in the future there will be more emphasis on the use of the Earth's resources and their sustainability and more accountability of engineers' decisions. In this context, it is entirely appropriate that the Symposium venue for the young scholars was in China because of the rock mechanics related work that is anticipated in the future. For example, in the Chinese Academy of Sciences report *Energy Science and Technology in China: A Roadmap to 2050*, it is predicted that China's total energy demand will reach 31.45, 61.66, and 66 x 10⁸ tce (tonnes of coal equivalent) in 2010, 2020, 2035, and 2050. The associated per capita energy consumption for the same years is estimated at 2.3, 3.1, 4.1, and 4.6 tce. This increasing demand will be met, inter alia, by the continued operation and development of new coal mines, hydroelectric plants, and nuclear power stations with one or more underground nuclear waste repositories, all of which will be improved by more modern methods of rock engineering design developed by young scholars. In particular, enhanced methods of site investigation, rock characterisation, rock failure understanding, computer modelling, and rock excavation and support are needed. The topics in the book include contributions on field investigation and observation, rock constitutive relations and property testing, numerical and physical modeling for rock engineering, information technology, artificial intelligence, and other advanced techniques, underground and surface excavation and reinforcement techniques, dynamic rock mechanics and blasting, prediction and prevention of geo-environmental hazard, case studies of typical rock engineering. Many of the 200 papers address these topics and demonstrate the skills of the young scholars, indicating that we can be confident in the continuing development of rock mechanics and rock engineering, leading to more efficient, safer, and economical structures built on and in rock masses. *Rock Mechanics: Achievements and Ambitions* will appeal to professionals, engineers, and academics in rock mechanics, rock engineering, tunnelling, mining, earthquake engineering, rock dynamics, and geotechnical engineering.
