In Living Color Rochelle A. Diamond, Susan DeMaggio, 2012-12-06 Advances in the field of cell biology have always been closely related to the development of quantitative analytical methods that can be applied to individual cells or cell organelles Almost from the early stages following the invention of the microscope the investigator has been keenly interested in obtaining information on the functionality of single cells and how cells perform under different sets of experimental conditions Although cells could be viewed in the microscope for a few hundred years only since the relatively recent application of autoradiography did we come to realize that although cells may visually appear very much alike they are quite different in their functional capacity The quest to understand these differences in a cell population lead to a new series of techniques for labeling and quantitating DNA content and similar approaches have driven the development of methods for analyzing various other cellular properties The development of new analytical techniques follows the age old pattern of applying successes of the past with current innovation logic and new biological information Results from autoradiography expanded the concept of the cell cycle from inter phase and mitosis to the more definitive G₀ G₁ S and G₂ M phases This new knowledge lead to the development of technology to measure and analyze various parameters related to the cell cycle

Engineering of Stem Cells Ulrich Martin, 2009-09-25 I am very pleased to present this volume on engineering stem cells in Advances in Biochemical Engineering and Biotechnology This volume stays abreast of recent developments in stem cell biology and the high expectations concerning the development of stem cell based regenerative therapies Regenerative medicine is the focus of current biomedical research with unique challenges related to scientific technical and ethical issues of stem cell research and the potential added value of connecting biomedicine with enabling technologies such as materials sciences mechanical and nano engineering Research activities in regenerative medicine include strategies in endogenous regeneration of injured or degenerated tissues by means of gene therapy or cell transplantation as well as complex approaches to replace or reconstruct lost or malformed tissue structures by applying tissue engineering approaches In most cases the specified functional cell types of interest cannot be isolated from the diseased organ or expanded to a sufficient degree and various stem and progenitor cell types represent the only applicable cell source In almost all cases stem cells have to be engineered sometimes for functional improvement in many cases to produce large numbers of cells and frequently to achieve efficient and specific differentiation in the cell types of interest
