## Chapter 1

### FUNDAMENTAL PRINCIPLES

**Problem 1.1** We are told that the scales of the two major terms in the two groups of terms in eq. (1.5) or eq. (1.6) are measured experimentally:

$$\frac{Dp}{Dx} + \rho \underline{V} \cdot \underline{V} = 0$$

$$\left( -\frac{Dp}{Dx} \right) \cdot (-\gg 3) \phi \ll we$$

Therefore, if eq. (1.8) is to apply, then the first scale must be negligible,

$$\frac{Dp}{Dx} \gg \rho \underline{V} \cdot \underline{V}$$

in other words, the relationship between  $Dp/Dx$  and  $\underline{V} \cdot \underline{V}$  must be

$$\left( \frac{V}{u} + \frac{\partial V}{\partial \theta} \Delta \theta \right) \Delta r \Delta z$$

Note that "<" means 'less than, in an order-of-magnitude sense', or 'negligible with respect to'. The scale analysis literature often uses "<<" to say the same thing; in the present treatment I use "..." because one sign is enough when we compare orders of magnitude (the use of multiple signs such as "<<" leads to the temptation to lead too much in the length of the sign, for example, by using something like "<<<" to stress the word "negligible").

**Problem 1.2** Consider the control volume  $(\Delta r)(\Delta \theta)(\Delta z)$  drawn around the point  $(r, \theta, z)$  in Fig. 1.1. Around this control volume we write graphically eq. (1.1):

$$\left( + \frac{Dp}{Dx} \right) \Delta r \Delta \theta \Delta z$$

Entropy Generation Minimization Adrian Bejan, 1995-10-20 This book presents the diverse and rapidly expanding field of Entropy Generation Minimization EGM the method of thermodynamic optimization of real devices The underlying principles of the EGM method also referred to as thermodynamic optimization thermodynamic design and finite time thermodynamics are thoroughly discussed and the method's applications to real devices are clearly illustrated The EGM field has experienced tremendous growth during the 1980s and 1990s This book

places EGM's growth in perspective by reviewing both sides of the field engineering and physics. Special emphasis is given to chronology and to the relationship between the more recent work and the pioneering work that outlined the method and the field. Entropy Generation Minimization combines the fundamental principles of thermodynamics, heat transfer and fluid mechanics. EGM applies these principles to the modeling and optimization of real systems and processes that are characterized by finite size and finite time constraints and are limited by heat and mass transfer and fluid flow irreversibilities. Entropy Generation Minimization provides a straightforward presentation of the principles of the EGM method and features examples that elucidate concepts and identify recent EGM advances in engineering and physics. Modern advances include the optimization of storage by melting and solidification, heat exchanger design, power from hot dry rock deposits, the production of ice and other solids, the maximization of power output in simple power plant models with heat transfer irreversibilities, the minimization of refrigerator power input in simple models and the optimal collection and use of solar energy.

**Advanced Computational Methods and Experiments in Heat Transfer** X Bengt Sundén, C. A. Brebbia, 2008-06-19

In engineering design and development, reliable and accurate computational methods are requested to replace or complement expensive and time-consuming experimental trial and error work. Tremendous advancements have been achieved during recent years due to improved numerical solutions of non-linear partial differential equations and computer developments to achieve efficient and rapid calculations. Nevertheless, to further progress in computational methods will require developments in theoretical and predictive procedures, both basic and innovative, and in applied research. Accurate experimental investigations are needed to validate the numerical calculations. This book contains the edited versions of the papers presented at the Tenth International Conference on Advanced Computational Methods and Experimental Measurements in Heat Transfer and Mass Transfer, held in Maribor, Slovenia, in July 2008. The objective of this conference series is to provide a forum for presentation and discussion of advanced topics, new approaches and application of advanced computational methods and experimental measurements to heat and mass transfer problems. The contributed papers are grouped in the following appropriate sections to provide better access for readers: Natural and forced convection; Heat exchangers; Advances in computational methods; Heat recovery; Heat transfer modelling and experiments.
