Penman, Modadugu V. Gupta, Madan Mohan Dey, 2005 There are over 1300 species of cyprinids in Asia and these are utilized by people for food

capture fisheries and aquaculture and as ornamental species This publication focuses on cyprinid species that are bred in hatcheries and used in aquaculture and restocking activities Introduced and threatened species of cyprinids in Asia are also discussed We are well aware that we have not covered many other cyprinid species that are utilized by people in Asia in various ways wild species in capture fisheries self recruiting species in aquaculture ponds and other water bodies and aquarist species

**Genomics in Aquaculture to Better Understand Species Biology and Accelerate Genetic Progress** José Manuel Yáñez, Ross Houston, Scott Newman, 2016-09-15 From a global perspective aquaculture is an activity related to food production with large potential for growth Considering a continuously growing population the efficiency and sustainability of this activity will be crucial to meet the needs of protein for human consumption in the near future However for continuous enhancement of the culture of both fish and shellfish there are still challenges to overcome mostly related to the biology of the cultured species and their interaction with increasingly changing environmental factors Examples of these challenges include early sexual maturation feed meal replacement immune response to infectious diseases and parasites and temperature and salinity tolerance Moreover it is estimated that less than 10% of the total aquaculture production in the world is based on populations genetically improved by means of artificial selection Thus there is considerable room for implementing breeding schemes aimed at improving productive traits having significant economic impact By far the most economically relevant trait is growth rate which can be efficiently improved by conventional genetic selection i e based on breeding values of selection candidates However there are other important traits that cannot be measured directly on selection candidates such as resistance against infectious and parasitic agents and carcass quality traits e g fillet yield and meat color However these traits can be more efficiently improved using molecular tools to assist breeding programs by means of marker assisted selection using a few markers explaining a high proportion of the trait variation or genomic selection using thousands of markers to estimate genomic breeding values The development and implementation of new technologies applied to molecular biology and genomics such as next generation sequencing methods and high throughput genotyping platforms are allowing the rapid increase of availability of genomic resources in aquaculture species These resources will provide powerful tools to the research community and will aid in the determination of the genetic factors involved in several biological aspects of aquaculture species In this regard it is important to establish discussion in terms of which strategies will be more efficient to solve the primary challenges that are affecting aquaculture systems around the world The main objective of this Research Topic is to provide a forum to communicate recent research and implementation strategies in the use of genomics in aquaculture species with emphasis on 1 a better understanding of fish and shellfish biological processes having considerable impact on aquaculture systems and 2 the efficient incorporation of molecular information into breeding programs to accelerate genetic progress of economically relevant traits

**Biotechnology and Genetics in Fisheries and Aquaculture** Andy Beaumont, Pierre Boudry, Kathryn Hoare, 2010-04-26

Following the extremely well-received structure of the first edition, this carefully revised and updated new edition now includes much new information of vital importance to those working and researching in the fisheries and aquaculture industries. Commencing with chapters covering genetic variation and how it can be measured, the authors then look at genetic structure in natural populations, followed by a new chapter covering genetics in relation to population size and conservation issues. Genetic variation of traits and triploids and the manipulation of ploidy are fully covered, and another new chapter is included entitled From Genetics to Genomics. The book concludes with a chapter covering the impact of genetic engineering in aquaculture. With the inclusion of a wealth of up-to-date information, new text and figures, and the inclusion of a third author, Pierre Boudry, the second edition of *Biotechnology and Genetics in Fisheries and Aquaculture* provides an excellent text and reference of great value and use to upper-level students and professionals working across fish biology, aquatic sciences, fisheries, aquaculture, genetics, and biotechnology. Libraries in all universities and research establishments where biological sciences, fisheries, and aquaculture

are studied and taught should have several copies of this excellent new edition on their shelves Completely updated revised and expanded new edition Subject area of ever increasing importance Expanded authorship Commercially useful information for fish breeders     *DNA & Genetic Engineering* Robert Snedden, 2007-08-25 This title explains how DNA is put together and how its code is read and acted upon by the cell to make proteins This book explores genetic engineering and gene therapy as well as the highly controversial areas of stem cell research and cloning Up to date examples are given such as the recent use of blood from a baby's umbilical cord to provide stem cells for the testing of new drugs
