Organic Structure Analysis Phillip Crews, Jaime Rodriguez, Marcel Jaspars, 2010-10-28 Organic Spectroscopy is a standard chemistry course offered each year to large numbers of seniors and beginning graduate students They learn to efficiently solve problems of molecular structure determination by an integrated use of four primary spectroscopic methods NMR mass spectrometry infrared and ultraviolet The problem solving approach used in the second edition follows the actual information flow used by practitioners solving molecular structures and not the standard methods based approach used in other texts In the ten years since the last edition published there have been significant changes in spectroscopic instrumentation and these are reflected throughout this text New sections have been included where the first edition omitted coverage and all chapters are updated with the most recent developments in the field Major changes have been made in the pivotal chapters covering multipulse 1D and 2D nuclear magnetic resonance methods and the chapters covering mass spectrometric methods have been split from two into three to increase content on modern MS methodology As examples in NMR selective pulses and their uses 15N 2D methods and computer assisted structure elucidation has been included and there is now a section on NOESY and ROESY For MS the three chapters cover core techniques and ionization processes small and large molecule analysis and fragmentation processes A hallmark of this text is the focus on chemical structure and the text revolves around how relevant information regarding skeleton functional groups and stereochemistry can be derived and the benefits disadvantages of particular approaches The straightforward writing style and use of illustrative examples clearly reproduced spectra and a large number of problems make this text more
