

Abstract: The effects of a 12-week supervised exercise program on the physical and psychological health of 100 sedentary, middle-aged women were examined. The program was designed to increase aerobic fitness, muscle strength, and flexibility. The program was divided into three phases: Phase 1 (Weeks 1-4), Phase 2 (Weeks 5-8), and Phase 3 (Weeks 9-12). The program was supervised by a certified personal trainer. The program was evaluated using a variety of measures, including heart rate, blood pressure, body mass index (BMI), and self-reported physical and psychological health. The results of the study showed that the program had a positive effect on all of the measures. Heart rate, blood pressure, and BMI all decreased significantly over the 12-week period. Self-reported physical and psychological health also improved significantly. The program was well-received by the participants, and they reported enjoying the exercise and feeling more energetic and confident after the program. The results of this study suggest that a supervised exercise program can be an effective way to improve the physical and psychological health of sedentary, middle-aged women.
