

Test Notes- Earthquakes

- An **earthquake** is the shaking and trembling that results from sudden movement of the Earth's crust. This movement in the Earth's plates results in a change of the Earth's surface.
- At least 1 million earthquakes occur each year! Many of them are too small to feel.
- A **Tsunami** is caused by an earthquake that occurs on the ocean floor. The safest place to be during a tsunami is in the middle of the open ocean!
- When two plates pull away from each other in opposite directions magma erupts which causes a new crust to form.
- California has more earthquakes than any other states because it lies on two plates that are moving away from each other.
- A **Focus**, also known as a **hypocenter**, is the place in the crust where the earthquake begins.
- The **epicenter** is the point on the earth's surface directly above the focus.
- The **magnitude** of an earthquake refers to the strength of an earthquake.
- A **seismologist** is a person who studies earthquakes.
- A **seismograph** is an instrument used to measure seismic waves.
- The **Richter Scale** is used to measure the strength of an earthquake. It was created by Charles Richter and Beno Gutenberg in 1935. It uses a base-10 scale.
 - example : an earthquake with a magnitude of 8 is 10,000 times stronger than an earthquake with a magnitude of 4.
- **Seismic Waves**
 - **Primary Waves (P-waves):**
 - The fastest seismic wave- can go through solids liquids and gases.
 - **Secondary Waves (S-waves):**
 - Slower than a p-wave- cannot travel through liquids and gases- speeds up through denser materials.
 - **Surface Waves (L-waves):**
 - Slowest of all seismic waves- the most destructive wave because it travels on earth's surface.
