

## 19. Electroplating

Objects may be plated with silver or gold for aesthetic incentive

The object to be plated is always placed at the cathode

The material to provide the plating is always placed at the anode

Silver electroplating:

The mass of the silver electrode at the anode decreases over time as a thin silver layer forms on the object at the cathode

Tin plating may also be done through this method

## 20. Electrolytic purification

Copper and gold can both be purified through electrolysis

Impure sample ["blister copper"] placed at the anode and a pure sample forms at the cathode

Copper electrolytic refining:

DC supply is small so only the metals more reactive than copper will oxidise. Thus, gold, silver and platinum components of the impure sample fall to the bottom of the cell in a 'anode sludge' as they will only oxidise with a higher DC voltage.

All other reactive metals oxidise forming ions but only copper ions will be able to reduce at the cathode as all other metals will require a higher DC voltage.

The cathode will hence become a 99.95% pure sample of copper
