Examine with experiment the dependence of the freezing point depression constant ( $K_f$ ) of water.

### Introduction:

When a solute is dissolved in a solvent, the resulting solution has a lower vapor pressure, a lower boiling point, a higher freezing point, and a lower refractive index than the pure solvent. The freezing point depression constant ( $K_f$ ) is a measure of the extent to which the freezing point of a solvent is lowered by the addition of a solute. The freezing point depression constant ( $K_f$ ) is a measure of the extent to which the freezing point of a solvent is lowered by the addition of a solute. The freezing point depression constant ( $K_f$ ) is a measure of the extent to which the freezing point of a solvent is lowered by the addition of a solute. The freezing point depression constant ( $K_f$ ) is a measure of the extent to which the freezing point of a solvent is lowered by the addition of a solute.

The purpose of this experiment is to determine the value of the freezing point depression constant ( $K_f$ ) for water. The experiment will be carried out by measuring the freezing point of a pure solvent and then measuring the freezing point of a solution of a known concentration of solute. The difference between the two freezing points will be used to calculate the value of  $K_f$ .

The following equation relates the freezing point depression constant ( $K_f$ ) to the molal concentration of the solute:

In practice, the freezing point depression constant ( $K_f$ ) is determined by measuring the freezing point of a pure solvent and then measuring the freezing point of a solution of a known concentration of solute.
