Handbook of Human Factors for Automated, Connected, and Intelligent Vehicles

Donald L. Fisher, William J. Horrey, John D. Lee, Michael A. Regan, 2020-05-31 Handbook of Human Factors for Automated Connected and Intelligent Vehicles Subject Guide Ergonomics Human Factors Automobile crashes are the seventh leading cause of death worldwide resulting in over 1.25 million deaths yearly. Automated connected and intelligent vehicles have the potential to reduce crashes significantly while also reducing congestion, carbon emissions, and increasing accessibility. However, the transition could take decades. This new handbook serves a diverse community of stakeholders including human factors researchers, transportation engineers, regulatory agencies, automobile manufacturers, fleet operators, driving instructors, vulnerable road users, and special populations. It provides information about the human driver, other road users, and human automation interaction in a single integrated compendium in order to ensure that automated connected and intelligent vehicles reach their full potential. Features: Addresses four major transportation challenges: crashes, congestion, carbon emissions, and accessibility from a human factors perspective. Discusses the role of the human operator relevant to the design, regulation, and evaluation of automated connected and intelligent vehicles. Offers a broad treatment of the critical issues and technological advances for the designing of transportation systems with the driver in mind. Presents an understanding of the human factors issues that are central to the public acceptance of these automated connected and intelligent vehicles. Leverages lessons from other domains in understanding human interactions with automation. Sets the stage for future research by defining the space of unexplored questions.

Clinical Pathways in Stroke Rehabilitation

Thomas Platz, 2021-01-14 This open access book focuses on practical clinical problems that are frequently encountered in stroke rehabilitation. Consequences of diseases, e.g., impairments and activity limitations, are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation, bridging the gap between clinical evidence and clinical decision making. The clinical pathways answer the questions: which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations, and are well acceptable to stroke survivors, as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic but concise review of the evidence: RCTs, systematic reviews, and meta-analyses that is relevant for clinical decision making, and comments on assessment, therapy, training, technology, medication, and the use of technical aids as appropriate. Based on these summaries, clinical algorithms/pathways are provided, and the main clinical decision situations are portrayed. The book is invaluable for all neurorehabilitation team members: clinicians, nurses, and therapists in neurology, physical medicine, and rehabilitation, and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision making for

individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives
