

FINANCE PRACTICE PROBLEMS

Interest

Interest is the cost of borrowing money. An interest rate is the cost stated as a percent of the amount borrowed per period of time, usually one year. The prevailing market rate is composed of:

1. The **Real Rate of Interest** that compensates lenders for postponing their own spending during the term of the loan.
2. An **Inflation Premium** to offset the possibility that inflation may erode the value of the money during the term of the loan. A unit of money (dollar, peso, etc) will purchase progressively fewer goods and services during a period of inflation, so the lender must increase the interest rate to compensate for that loss.
3. Various **Risk Premiums** to compensate the lender for risky loans such as those that are unsecured, made to borrowers with questionable credit ratings, or illiquid loans that the lender may not be able to readily resell.

The first two components of the interest rate listed above, the real rate of interest and an inflation premium, collectively are referred to as the **nominal risk-free rate**. In the U.S.A, the nominal risk-free rate can be approximated by the rate of US Treasury bills since they are generally considered to have a very small risk.

Simple Interest

Simple interest is calculated on the original principal only. Accumulated interest from prior periods is not used in calculations for the following periods. Simple interest is normally used for a single period of less than a year, such as 30 or 60 days.

$$F = P \times (1 + rt) \quad I = A - P \\ I = P \times rt$$

F: Future Value of the investment
P: principal (initial value of an investment)
r: annual interest rate in percentage (%)
t: interest after 1 years.

Example 1: Michelle invested \$5000.00 in mutual fund with the interest rate of 4.8%. How much interest would she earn after 2 years?

Answer :

$$P = \$5000.00 \quad r = 4.8\% \quad t = 2 \quad I = P \times r \times t \\ I = (\$5000.00)(4.8\%)(2) = \$480.00$$

Hence, Michelle would earn \$480 after 2 years.

Example 2:

Jeff has one savings account with the interest rate of 3.2%, and one money market account with the interest rate of 5.1% in a bank. If he deposits \$1200.00 to the savings account, and \$1800.00 to the money market account, how much money will he have after 6 years?

Answer:

Savings account:
