Human Chemistry (Volume Two) Libb Thims, 2007-09-01 Volume two begins with Goethe's theories of affinities i.e. the chemical reaction view of human life in 1809. This is followed by the history of how the thermodynamic 1876 and quantum 1905 revolutions modernized chemistry such that affinity, the force of reaction, is now viewed as a function of thermodynamic free energy, reaction spontaneity and quantum valency bond stabilities. The composition, energetic state dynamics and evolution of the human chemical bond A-B is the centerpiece of this process. The human bond is what gives yields and takes, absorbs energy in life. The coupling of this bond energy driven by periodic inputs of solar photons thus triggering activation energies and entropies connected to the dynamical work of life is what quantifies the human reaction process. This is followed by topics including mental crystallization, template theory, LGBT chemistry, chemical potential, Le Chatelier's principle, Muller dispersion forces and human thermodynamics.
