Desertification Land Degradation And Sustainability:

Desertification, Land Degradation and Sustainability Anton Imeson, 2012-01-24 Desertification offers a comprehensive overview of the subject and clearly emphasizes the link between local and global desertification processes and how past and current policy has affected arid environments and their populations This text adequately applies the research undertaken during the last 15 years on the topic Desertification has become increasingly politicized and there is a need to present and explain the facts from a global perspective This book tackles the issues surrounding desertification in a number of ways from differing scales local to global processes physical to human the relationship of desertification to current global development and management responses at different scales Desertification has been mainstreamed and integrated into other areas of concern and has consequently been ignored as a cross cutting issue The book redresses this balance Making use of much original data and information that has been undertaken by many scientists and practitioners during the last decade in different parts of the world Desertification Land Degradation and Sustainability is organised according to the principles of adaptive management and hierarchy theory and clearly explains desertification within a framework of evolving and interacting physical and socio economic systems In addition to research data the book also draws from the National Action Plans of different countries the IPCC Fourth Assessment on Climate Change and the Millennium assessments Clearly structured throughout the content of the book is organised at different scales local regional and global It also specifically explains processes linking top down and bottom up interactions and has a strong human component The historical cultural and physical context is also stressed Clearly organised into the following distinct sections a Concepts and processes b Data c Impacts d Responses e Case studies This text is essential for anyone studying desertification as part of an earth and environmental science degree

Economics of Land Degradation and Improvement - A Global Assessment for Sustainable Development Ephraim Nkonya, Alisher Mirzabaev, Joachim von Braun, 2015-11-11 This volume deals with land degradation which is occurring in almost all terrestrial biomes and agro ecologies in both low and high income countries and is stretching to about 30% of the total global land area About three billion people reside in these degraded lands However the impact of land degradation is especially severe on livelihoods of the poor who heavily depend on natural resources The annual global cost of land degradation due to land use and cover change LUCC and lower cropland and rangeland productivity is estimated to be about 300 billion USD Sub Saharan Africa SSA accounts for the largest share 22% of the total global cost of land degradation Only about 38% of the cost of land degradation due to LUCC which accounts for 78% of the US 300 billion loss is borne by land users and the remaining share 62% is borne by consumers of ecosystem services off the farm The results in this volume indicate that reversing land degradation trends makes both economic sense and has multiple social and environmental benefits On average one US dollar investment into restoration of degraded land returns five US dollars The findings of the country case studies call for increased investments into the rehabilitation and restoration of

degraded lands including through such institutional and policy measures as strengthening community participation for sustainable land management enhancing government effectiveness and rule of law improving access to markets and rural services and securing land tenure The assessment in this volume has been conducted at a time when there is an elevated interest in private land investments and when global efforts to achieve sustainable development objectives have intensified In this regard the results of this volume can contribute significantly to the ongoing policy debate and efforts to design strategies for achieving sustainable development goals and related efforts to address land degradation and halt biodiversity loss

Land Degradation, Desertification and Climate Change Mark S. Reed,Lindsay C. Stringer,2016-04-28 Although much is known about the processes and effects of land degradation and climate change little is understood about the links between them Less still is known about how these processes are likely to interact in different social ecological systems around the world or how societies might be able to adapt to this twin challenge This book identifies key vulnerabilities to the combined effects of climate change and land degradation around the world It identifies triple win adaptations that can tackle both climate change and land degradation whilst supporting biodiversity and ecosystem services The book discusses methods for monitoring effects of climate change and land degradation and adaptations to these processes It argues for better co operation and knowledge exchange so that the research land user and policy communities can work together more effectively to tackle these challenges harnessing the wisdom of crowds to assess vulnerability and adapt to climate change and land degradation whilst protecting livelihoods and biodiversity
