Design and Analysis of Distributed Algorithms with Applications to Networked Traffic Systems Evan Gravelle, 2017 There are many benefits of solving problems in a decentralized manner Distributed algorithms often do not require global information which can alleviate the curse of dimensionality in large networks there is often robustness to failure of parts and they are often more robust to failure of parts and to dynamic changes to the environment that can occur while maintaining performance This dissertation will focus on three problems involving networked systems in which distributed algorithms have significant benefits constrained load balancing traffic congestion minimization and traffic intersection efficiency Many physical limitations of real systems are not considered in the literature of distributed load balancing algorithms We address the specific problem of quantized distributed load balancing over a network of agents subject to upper limit constraints We then shift focus to traffic systems where endowing traffic control systems with local information and communication can be exploited for further efficiency Motivated by a desire to reduce congestion we propose two distributed algorithms to reduce delays a dynamic lane reversal algorithm and a rerouting algorithm Finally we present a novel intersection control algorithm based on an objective function that accounts for drivers time preferences For each problem a specific objective is formed mathematically An algorithm is designed to achieve this objective and stability and convergence of the algorithms are analyzed Experiments are run through simulation to verify stability and convergence as well as to test performance

Analysis and Design of Distributed Optimization Algorithms Akhil Sundararajan,2021 This work concerns the analysis and design of distributed first order optimization algorithms The goal of such algorithms is to optimize a global function that is the average of local functions using only local computations and communications Many recent algorithms have been proposed that achieve linear convergence to the global optimum We provide a unified analysis that yields the worst case linear convergence rate as a function of the properties of the functions and underlying network as well as the parameters of the algorithm The framework requires solving a small semidefinite program whose feasibility is a sufficient condition for certifying linear convergence of a distributed algorithm We present results for both known fixed graphs and unknown time varying graphs The analysis framework is a computationally efficient method for distributed algorithm analysis that enables the rapid comparison selection and tuning of algorithms This work also makes an effort to systematize distributed algorithm design by devising a canonical form for first order distributed algorithms The canonical form characterizes any distributed algorithm that can be implemented using a single round of communication and gradient computation per iteration and where each agent stores up to two state variables The canonical form features a minimal set of parameters that are both unique and expressive enough to capture any distributed algorithm in this class Using this canonical form we propose a new algorithm which we call SVL that is easily implementable and achieves a faster worst case convergence rate than all other known algorithms

Potential-Based Analysis of Social, Communication, and Distributed Networks Seyed Rasoul Etesami,2017-03-13 This work makes major contributions to the thriving area of social communication and distributed networks by introducing novel methodologies and tools toward the study of the evolutionary behaviors of these networks as well as their computational complexity and rates of convergence By departing from the classical approaches and results in the literature this work shows that it is possible to handle more complex and realistic nonlinear models where either the traditional approaches fail or lead to weak results The author also develops several easily implementable algorithms delivering excellent performance guarantees while running faster than those that exist in the literature The study undertaken and the approaches adopted enable the analysis of the evolution of several different types of social and distributed networks with the potential to apply to and resolve several other outstanding issues in such networks
