**Encyclopedia of Information Science and Technology, Third Edition** Khosrow-Pour, D.B.A., Mehdi, 2014-07-31 This 10 volume compilation of authoritative research based articles contributed by thousands of researchers and experts from all over the world emphasized modern issues and the presentation of potential opportunities prospective solutions and future directions in the field of information science and technology Provided by publisher *Interconnect-Centric Design for Advanced SOC and NOC* Jari Nurmi, 2004-07-20 In Interconnect centric Design for Advanced SoC and NoC we have tried to create a comprehensive understanding about on chip interconnect characteristics design methodologies layered views on

different abstraction levels and finally about applying the interconnect centric design in system on chip design Traditionally on chip communication design has been done using rather ad hoc and informal approaches that fail to meet some of the challenges posed by next generation SOC designs such as performance and throughput power and energy reliability predictability synchronization and management of concurrency To address these challenges it is critical to take a global view of the communication problem and decompose it along lines that make it more tractable We believe that a layered approach similar to that defined by the communication networks community should also be used for on chip communication design The design issues are handled on physical and circuit layer logic and architecture layer and from system design methodology and tools point of view Formal communication modeling and refinement is used to bridge the communication layers and network centric modeling of multiprocessor on chip networks and socket based design will serve the development of platforms for SoC and NoC integration Interconnect centric Design for Advanced SoC and NoC is concluded by two application examples interconnect and memory organization in SoCs for advanced set top boxes and TV and a case study in NoC platform design for more generic applications Power-efficient Design of On-chip Interconnection Networks Hangsheng Wang, 2005

Building Efficient, Reconfigurable Hardware Using Hierarchical Interconnects Chengcheng Wang, 2013 In the semiconductor industry today ASICs are able to offer 10x 1000x higher energy and area efficiencies than non dedicated chips such as programmable DSP processors field programmable gate arrays FPGAs and microprocessors Not surprisingly SoCs today have become an integration of many ASIC blocks each performing a few dedicated tasks The growing size of modern SoC chips accelerated by the increasing demands for functionalities has exposed the major drawback of ASIC design cost These large SoCs are re designed a few times a year to rectify hardware bugs and to support new features Because ASICs are not reconfigurable even the smallest hardware change would require a re design Additionally design cost is rising exponentially with every technology generation The rising design cost of ASICs has exposed a huge need today efficiency and flexibility must co exist But among flexible hardware candidates microprocessors and programmable DSP processors are far too slow to meet the throughput requirements of ASICs FPGAs do come close in terms of performance but are extremely inefficient due to its high energy and large area overhead We must bridge the huge gap in efficiency for FPGA to become a viable contender to ASICs The primary culprit for FPGA inefficiency is interconnect which accounts for over 75% of area and delay For over 20 years 2D mesh network has been the back bone of FPGA interconnects but full connectivity in a 2D mesh require  $O(N^2)$  switches requiring interconnects to grow much faster than Moore's Law As a result various heuristics are used to simplify switch box arrays at the cost of resource utilization but interconnect area of modern FPGA is still around 80% This work builds FPGA using hierarchical interconnects based on Bene networks requiring  $O(N \log N)$  switches Although Bene is commonly used in telecommunication this work is its first silicon realization of a FPGA To realize a highly efficient interconnect architecture significant pruning of the network is required Novel techniques such as fast path U turns and

unbalanced branching are also implemented A custom place and route software is developed to map benchmark designs on a variety of interconnect candidates From mapping results the architecture is updated based on network utilization until an optimized design is converged The large area of FPGA chip requires aggressive power gating PG but interconnect signals often lack spatial locality make it block level PG difficult A novel PG circuit technique is developed to power gate individual interconnect switches with very small overhead in area and performance Such technique requires fundamental circuit changes even modifying the CMOS inverter With innovations in chip architecture circuit design and extensive software development this work has demonstrated 5 user mappable FPGAs from 1K 16K LUTs all with around 50% interconnect area a 3 4x reduction from commercial FPGAs while preserving connectivity An energy efficiency of 1.1 GOPS mW is the highest among reported FPGAs and is 22x more efficient than the most efficient commercial FPGA today significantly bridging the efficiency gap between FPGA and ASIC
