The Computer and the Mind Philip Nicholas Johnson-Laird, 1988 In a field choked with seemingly impenetrable jargon Philip N Johnson Laird has done the impossible written a book about how the mind works that requires no advance knowledge of artificial intelligence neurophysiology or psychology The mind he says depends on the brain in the same way as the execution of a program of symbolic instructions depends on a computer and can thus be understood by anyone willing to start with basic principles of computation and follow his step by step explanations The author begins with a brief account of the history of psychology and the birth of cognitive science after World War II He then describes clearly and simply the nature of symbols and the theory of computation and follows with sections devoted to current computational models of how the mind carries out all its major tasks including visual perception learning memory the planning and control of actions deductive and inductive reasoning and the formation of new concepts and new ideas Other sections discuss human communication meaning the progress that has been made in enabling computers to understand natural language and finally the difficult problems of the conscious and unconscious mind free will needs and emotions and self awareness In an envoi the author responds to the critics of cognitive science and defends the computational view of the mind as an alternative to traditional dualism cognitive science integrates mind and matter within the same explanatory framework This first single authored introduction to cognitive science will command the attention of students of cognitive science at all levels including psychologists linguists computer scientists philosophers and neuroscientists as well as all readers curious about recent knowledge on how the mind works
