**Computer Processing of Remotely-Sensed Images** Paul M. Mather, 2004-06-28 Remotely sensed images of the Earth provide information about the geographical distribution of natural and cultural features as well as a record of changes in environmental conditions over time This text offers technical guidance to those involved in processing and classifying such data

*Computer Processing of Remotely-Sensed Images* Paul M. Mather, Magaly Koch, 2022-04-11 Computer Processing of Remotely Sensed Images A thorough introduction to computer processing of remotely sensed images processing methods and applications Remote sensing is a crucial form of measurement that allows for the gauging of an object or space without direct physical contact allowing for the assessment and recording of a target under conditions which would normally render access difficult or impossible This is done through the analysis and interpretation of electromagnetic radiation EMR that is reflected or emitted by an object surveyed and recorded by an observer or instrument that is not in contact with the target This methodology is particularly of importance in Earth observation by remote sensing wherein airborne or satellite borne instruments of EMR provide data on the planet's land seas ice and atmosphere This permits scientists to establish relationships between the measurements and the nature and

distribution of phenomena on the Earth's surface or within the atmosphere. Still relying on a visual and conceptual approach to the material, the fifth edition of this successful textbook provides students with methods of computer processing of remotely sensed data and introduces them to environmental applications which make use of remotely sensed images. The new edition's content has been rearranged to be more clearly focused on image processing methods and applications in remote sensing, with new examples including material on the Copernicus missions, microsatellites, and recently launched SAR satellites, as well as time series analysis methods. The fifth edition of *Computer Processing of Remotely Sensed Images* also contains a cohesive presentation of the fundamental components of Earth observation remote sensing that is easy to understand and highly digestible. Largely non-technical language providing insights into more advanced topics that may be too difficult for a non-mathematician to understand. Illustrations and example boxes throughout the book to illustrate concepts, as well as revised examples that reflect the latest information. References and links to the most up-to-date online and open access sources used by students. *Computer Processing of Remotely Sensed Images* is a highly insightful textbook for advanced undergraduates and postgraduate students taking courses in remote sensing and GIS in Geography, Geology, and Earth/Environmental Science departments. **Computer Processing of Remotely-Sensed Images** Paul M.

Mather, 2005-12-13. Remotely sensed images of the Earth's surface provide a valuable source of information about the geographical distribution and properties of natural and cultural features.
