**Early Category and Concept Development : Making Sense of the Blooming, Buzzing Confusion** David H. Rakison Assistant Professor of Psychology Carnegie Mellon University, Lisa M. Oakes Associate Professor of Psychology University of Iowa, 2003-01-09 Whether or not infants earliest perception of the world is a blooming buzzing confusion it is not long before they come to perceive structure and order among the objects and events around them At the core of this process and cognitive development in general is the ability to categorize to group events objects or properties together and to form mental representations or concepts that encapsulate the commonalities and structure of these categories Categorization is the primary means of coding experience underlying not only perceptual and reasoning processes but also inductive inference and language The aim of this book is to bring together the most recent findings and theories about the origins and early development of categorization and conceptual abilities Despite recent advances in our understanding of this area a number of hotly debated issues remain at the center of the controversy over categorization Researchers continue to ask questions such as Which mechanisms for categorization are

available at birth and which emerge later What are the relative roles of perceptual similarity and nonobservable properties in early classification What is the role of contextual variation in categorization by infants and children Do different experimental procedures reveal the same kind of knowledge Can computational models simulate infant and child categorization How do computational models inform behavioral research What is the impact of language on category development How does language partition the world This book is the first to address these and other key questions within a single volume The authors present a diverse set of views representing cutting edge empirical and theoretical advances in the field The result is a thorough review of empirical contributions to the literature and a wealth of fresh theoretical perspectives on early categorization

**The Hidden Structure of Interaction** Luigi Anolli, 2005 The idea of complexity states that most things tend to organize themselves into recurring patterns even when these patterns are not immediately visible to an external observer The general name for the scientific field concerned with the behaviour over time of a dynamic system is complexity theory The dynamic systems systems capable of changing over time are the focus of this approach and its concern is with the predictability of their behaviour The systems of interest to the complexity theory under certain conditions perform in regular predictable ways under other conditions they exhibit behaviour in which regularity and predictability is lost The concepts of stable and unstable behaviour are part of the traditional repertoire of physical science What is novel is the concept of something in between chaotic behaviour For chaos here we refer to systems which display behaviour that though it has certain regularities defies prediction How does the order emerge from the chaos How can we predict the behaviour of a chaotic system Over the last 30 years and more trying to identify the hidden patterns behind chaotic behaviour became the focus of attention in a number of scientific disciplines These range as widely as astronomy chemistry evolutionary biology
