Morphological Plant Modeling: Unleashing Geometric and Topological Potential within the Plant Sciences

Alexander Bucksch, Dan Chitwood, 2017-10-13 An increasing population faces the growing demand for agricultural products and accurate global climate models that account for individual plant morphologies to predict favorable human habitat Both demands are rooted in an improved understanding of the mechanistic origins of plant development Such understanding requires geometric and topological descriptors to characterize the phenotype of plants and its link to genotypes However the current plant phenotyping framework relies on simple length and diameter measurements which fail to capture the exquisite architecture of plants The Research Topic Morphological Plant Modeling Unleashing Geometric and Topological Potential within the Plant Sciences is the result of a workshop held at National Institute for Mathematical and Biological Synthesis NIMBioS in Knoxville Tennessee From 2 4 September 2015 over 40 scientists from mathematics computer science engineering physics and biology came together to set new frontiers in combining plant phenotyping with recent results from shape theory at the interface of geometry and topology In doing so the Research Topic synthesizes the views from multiple disciplines to reveal the potential of new mathematical concepts to analyze and quantify the relationship between morphological plant features As such the Research Topic bundles examples of new mathematical techniques including

persistent homology graph theory and shape statistics to tackle questions in crop breeding developmental biology and vegetation modeling The challenge to model plant morphology under field conditions is a central theme of the included papers to address the problems of climate change and food security that require the integration of plant biology and mathematics from geometry and topology research applied to imaging and simulation techniques The introductory white paper written by the workshop participants identifies future directions in research education and policy making to integrate biological and mathematical approaches and to strengthen research at the interface of both disciplines

Implicit Objects in Computer Graphics Luiz Velho, Jonas Gomes, Luiz H. de Figueiredo, 2007-05-08 Implicit definition and description of geometric objects and surfaces plays a critical role in the appearance and manipulation of computer graphics In addition the mathematical definition of shapes using an implicit form has pivotal applications for geometric modeling visualization and animation Until recently the parametric form has been by far the most popular geometric representation used in computer graphics and computer aided design Whereas parametric objects and the techniques associated with them have been exhaustively developed the implicit form has been used as a complementary geometric representation mainly in the restricted context of specific applications However recent developments in graphics are changing this situation and the community is beginning to draw its attention to implicit objects This is reflected in the current research of aspects related to this subject Employing a coherent conceptual framework *Implicit Objects in Computer Graphics* addresses the role of implicitly defined objects in the following parts mathematical foundations of geometric models implicit formulations for the specification of shapes implicit primitives techniques for constructing and manipulating implicit objects modeling rendering and animating implicit objects

Adaptive Hierarchical Isogeometric Finite Element Methods Anh-Vu Vuong, 2012-05-01 Isogeometric finite elements combine the numerical solution of partial differential equations and the description of the computational domain given by rational splines from computer aided geometric design This work gives a well founded introduction to this topic and then extends isogeometric finite elements by a local refinement technique which is essential for an efficient adaptive simulation Thereby a hierarchical approach is adapted to the numerical requirements and the relevant theoretical properties of the basis are ensured The computational results suggest the increased efficiency and the potential of this local refinement method
