Open The Open Courses Library,2019-12-12 Direct Connections in Computer Networks A Systems Approach Networks consist of links interconnecting nodes One of the fundamental problems we face is how to connect two nodes together We know the cloud abstraction to represent a network without revealing all of its internal complexities So we need to address the similar problem of connecting a host to a cloud This in effect is the problem every Internet Service Provider ISP faces when it wants to connect a new customer to its network Whether we want to construct a trivial two node network with one link or connect the one billionth host to an existing network like the Internet we need to address a common set of issues First we need some physical medium over which to make the connection The medium may be a length of wire a piece of optical fiber or some less tangible medium such as air through which electromagnetic radiation e g radio waves can be transmitted It may cover a small area e g an office building or a wide area e g transcontinental Chapter Outline Problem Connecting to a Network Technology Landscape Encoding Framing Error Detection Reliable Transmission Multi Access Networks Wireless Networks Access Networks Perspective Race to the Edge The Open Courses Library introduces you to the best Open Source Courses *Computer Networks* Larry L. Peterson,Bruce S. Davie,2003-05-27 In this new edition of their classic and

bestselling textbook authors Larry Peterson and Bruce Davie continue to emphasize why networks work the way they do. Their system approach treats the network as a system composed of interrelated building blocks as opposed to strict layers giving students and professionals the best possible conceptual foundation on which to understand current networking technologies as well as the new ones that will quickly take their place. Incorporating instructor and user feedback, this edition has also been fully updated and includes all new material on MPLS and switching, wireless and mobile technology, peer-to-peer networks, IPv6 overlay and content distribution networks, and more. As in the past, all instruction is rigorously framed by problem statements and supported by specific protocol references, C code examples, and thought-provoking end-of-chapter exercises. **Computer Networks: A Systems Approach** remains an essential resource for a successful classroom experience and a rewarding career in networking. Written by an author team with over thirty years of first-hand experience in networking research, development, and teaching, two leaders in the work of defining and implementing many of the protocols discussed in the book. Includes all new coverage and updated material on MPLS and switching, wireless and mobile technology, peer-to-peer networks, IPv6 overlay and content distribution networks, VPNs, IP Telephony, network security, and multimedia communications. SIP, SDP. Additional and earlier focus on applications in this edition makes core protocols more accessible and more meaningful to readers already familiar with networked applications. Features chapter framing statements, over 400 end-of-chapter exercises, example exercises with solutions, shaded sidebars covering advanced topics, web resources, and other proven pedagogical features.

End-To-End Data The Open The Open Courses Library, 2019-12-11. End to End Data. **Computer Networks: A Systems Approach**. From the network's perspective, application programs send messages to each other. Each of these messages is just an uninterpreted string of bytes. From the application's perspective, however, these messages contain various kinds of data: arrays of integers, video frames, lines of text, digital images, and so on. In other words, these bytes have meaning. We now consider the problem of how best to encode the different kinds of data that application programs want to exchange into byte strings. In many respects, this is similar to the problem of encoding byte strings into electromagnetic signals. Thinking back to our discussion of encoding, there are essentially two concerns. The first is that the receiver be able to extract the same message from the signal as the transmitter sent; this is the framing problem. The second is making the encoding as efficient as possible. Both of these concerns are also present when encoding application data into network messages.
