Computer Modelling In Atmospheric And Oceanic Sciences:

Computer Modelling in Atmospheric and Oceanic Sciences Peter K. Müller, Hans von Storch, 2004-06-21 The book describes what these models are what they are based on how they function and then most innovatively how they can be used to generate new useful knowledge about the environmental system Discusses this generation of knowledge by computer models from an epistemological perspective and illustrates it by numerous examples from applied and fundamental research Includes ample technical appendices and is a valuable source of information for graduate students and scientists alike working in the field of environmental sciences

The Equations of Oceanic Motions Peter Müller, 2006-09-28 Modeling and prediction of oceanographic phenomena and climate is based on the integration of dynamic equations The Equations of Oceanic Motions derives and systematically classifies the most common dynamic equations used in physical oceanography from large scale thermohaline circulations to those governing small scale motions and turbulence After establishing the basic dynamical equations that describe all oceanic motions Müller then derives approximate equations emphasizing the assumptions made and physical processes eliminated He distinguishes between geometric thermodynamic and dynamic approximations and between the acoustic gravity vortical and temperature salinity modes of motion Basic concepts and formulae of equilibrium thermodynamics vector and tensor calculus curvilinear coordinate systems and the kinematics of fluid motion and wave propagation are covered in appendices Providing the basic theoretical background for graduate students and researchers of physical oceanography and climate science this book will serve as both a comprehensive text and an essential reference

Geophysical Fluid Dynamics II Emin Özsoy, 2021-08-13 This book develops a fundamental understanding of geophysical fluid dynamics based on a mathematical description of the flows of inhomogeneous fluids It covers these topics 1 development of the equations of motion for an inhomogeneous fluid 2 review of thermodynamics 3 thermodynamic and kinetic energy equations 4 equations

of state for the atmosphere and the ocean salt and moisture effects 5 concepts of potential temperature and potential density 6 Boussinesq and quasi geostrophic approximations 7 conservation equations for vorticity mechanical and thermal energy instability theories internal waves mixing convection double diffusion stratified turbulence fronts intrusions gravity currents

Graduate students will be able to learn and apply the basic theory of geophysical fluid dynamics of inhomogeneous fluids on a rotating earth including 1 derivation of the governing equations for a stratified fluid starting from basic principles of physics 2 review of thermodynamics equations of state isothermal adiabatic isentropic changes 3 scaling of the equations Boussinesq approximation applied to the ocean and the atmosphere 4 examples of stratified flows at geophysical scales steady and unsteady motions inertia gravity internal waves quasi geostrophic theory 5 vorticity and energy conservation in stratified fluids 6 boundary layer convection in stratified containers and basins

Climate Science Concepts Born in Hamburg Hans von Storch, Martin Claussen, Martin Heimann, Robert Sausen, Eduardo Zorita, 2025-03-10 Since the foundation of the Max Planck Institute in 1975 with the now Nobel laureate Klaus Hasselmann as founding director the climate science in Hamburg has seen a remarkable boost Various ideas were brought forward implemented and tested Many of them ignited interest in the global scientific community thus adding significant momentum to the development of modern climate science The participants of the remarkable development since 1975 have come together to identify these concepts born in Hamburg In an introductory chapter the historical development including other significant developments of climate science in the late 19th and early 20th century are addressed The main part consists of chapters addressing the development of key innovative concepts These are chosen to describe ideas which have been suggested by scientists while working in Hamburg and have been taken up by the international community in applications and advancements such as the stochastic framing of dynamics and analysis adding carbon cycles to climate models multiple equilibria in climate models anomaly coupling downscaling and constructed proxies These ideas may not in all cases have been strictly new or firsts but they were the Hamburg publications which made the difference The book is mostly a book on scientific concepts and ideas less so a general history of climate science in Hamburg

Society And Climate: Transformations And Challenges Nico Stehr, Amanda Machin, 2019-07-30 Climate has for a long time been taken for granted background against which social political and economic interactions have taken place But this taken for granted background is cleaving It is becoming hard to ignore the potential repercussions of a changing climate and the uneven impact of certain forms of human society and energy cultures that risk undermining their own environmental conditions In a comprehensive and accessible way this book
