Computer Vision: Theory and Industrial Applications Carme Torras, 2012-12-06 This book is the fruit of a very long and elaborate process It was conceived as a comprehensive solution to several deficiencies encountered while trying to teach the essentials of Computer Vision in different contexts to technicians from industry looking for technological solutions to some of their problems to students in search of a good subject for a PhD thesis and to researchers in other fields who believe that Computer Vision techniques may help them to analyse their results The book was carefully planned with all these people in mind Thus it covers the fundamentals of both 2D and 3D Computer Vision and their most widespread industrial applications such as automated inspection robot guidance and workpiece acquisition The level of explanation is that of an expanded introductory text in the sense that besides the basic material some special advanced topics are included in each chapter together with an extensive bibliography for experts to follow up Well known researchers on each of the topics were appointed to write a chapter following several guidelines to ensure a consistent presentation throughout I would like to thank the authors for their patience because some of them had to go through several revisions of their chapters in order to avoid repetition and to improve the homogeneity and coherence of the book I hope they will find that the final result has been worth their efforts

Readings in Computer Vision Martin A. Fischler, Oscar Firschein, 2014-06-28 The field of computer vision combines techniques from physics mathematics psychology artificial intelligence and computer science to examine how machines might construct meaningful descriptions of their surrounding environment The editors of this volume prominent researchers and leaders of the SRI International AI Center Perception Group have selected sixty papers most published since 1980 with the viewpoint that computer vision is concerned with solving seven basic problems Reconstructing 3D scenes from 2D images Decomposing images into their component parts Recognizing and assigning labels to scene objects Deducing and describing relations among scene objects Determining the

nature of computer architectures that can support the visual function Representing abstractions in the world of computer memory Matching stored descriptions to image representation Each chapter of this volume addresses one of these problems through an introductory discussion which identifies major ideas and summarizes approaches and through reprints of key research papers Two appendices on crucial assumptions in image interpretation and on parallel architectures for vision applications a glossary of technical terms and a comprehensive bibliography and index complete the volume
