**CONCUR 2000 - Concurrency Theory** Catuscia Palamidessi, 2003-06-26 This volume contains the proceedings of the 11th International Conference on Concurrency Theory CONCUR 2000 held in State College Pennsylvania USA during 22-25 August 2000. The purpose of the CONCUR conferences is to bring together researchers, developers, and students in order to advance the theory of concurrency and promote its applications. Interest in this topic is continuously growing as a consequence of the importance and ubiquity of concurrent systems and their applications and of the scientific relevance of their foundations. The scope covers all areas of semantics, logics, and verification techniques for concurrent systems. Topics include concurrency-related aspects of models of computation, semantic domains, process algebras, Petri nets, event structures, real-time systems, hybrid systems, decidability, model checking, verification techniques, refinement techniques, term and graph rewriting, distributed programming, logic constraint programming, object-oriented programming, typing systems, and algorithms, case studies, tools, and environments for programming and verification. The first two CONCUR conferences were held in Amsterdam, NL, in 1990 and 1991. The following ones in Stony Brook, USA; Hildesheim, D; Uppsala, S; Philadelphia, USA; Pisa, I; Warsaw, PL; Nice, F; and Eindhoven, NL. The proceedings have appeared in Springer LNCS as Volumes 458, 527, 630, 715, 836, 962, 1119, 1243, 1466, and 1664.

*Secure Systems Development with UML* Jan Jürjens, 2005-11-18 Attacks against computer systems can cause considerable economic or physical damage High quality development of security critical systems is difficult mainly because of the conflict between development costs and verifiable correctness Jürjens presents the UML extension UMLsec for secure systems development It uses the standard UML extension mechanisms and can be employed to evaluate UML specifications for vulnerabilities using a formal semantics of a simplified fragment of UML Established rules of security engineering can be encapsulated and hence made available even to developers who are not specialists in security As one example Jürjens uncovers a flaw in the Common Electronic Purse Specification and proposes and verifies a correction With a clear separation between the general description of his approach and its mathematical foundations the book is ideally suited both for researchers and graduate students in UML or formal methods and security and for advanced professionals writing critical applications

**The Theory of Timed I/O Automata, Second Edition** Dilsun Kaynar, Nancy Lynch, Roberto Segala, Frits Vaandrager, 2022-06-01 This monograph presents the Timed Input Output Automaton TIOA modeling framework a basic mathematical framework to support description and analysis of timed computing systems Timed systems are systems in which desirable correctness or performance properties of the system depend on the timing of events not just on the order of their occurrence Timed systems are employed in a wide range of domains including communications embedded systems

real time operating systems and automated control Many applications involving timed systems have strong safety reliability and predictability requirements which make it important to have methods for systematic design of systems and rigorous analysis of timing dependent behavior The TIOA framework also supports description and analysis of timed distributed algorithms distributed algorithms whose correctness and performance depend on the relative speeds of processors accuracy of local clocks or communication delay bounds Such algorithms arise for example in traditional and wireless communications networks of mobile devices and shared memory multiprocessors The need to prove rigorous theoretical results about timed distributed algorithms makes it important to have a suitable mathematical foundation An important feature of the TIOA framework is its support for decomposing timed system descriptions In particular the framework includes a notion of external behavior for a timed I O automaton which captures its discrete interactions with its environment The framework also defines what it means for one TIOA to implement another based on an inclusion relationship between their external behavior sets and defines notions of simulations which provide sufficient conditions for demonstrating implementation relationships The framework includes a composition operation for TIOAs which respects external behavior and a notion of receptiveness which implies that a TIOA does not block the passage of time The TIOA framework also defines the notion of a property and what it means for a property to be a safety or a liveness property It includes results that capture common proof methods for showing that automata satisfy properties

The CSL 2002 Programme Committee considered 111 submissions from 28 countries during a two-week electronic discussion; each paper was refereed by at least three reviewers. The Committee selected 37 papers for presentation at the conference and publication in these proceedings. The Programme Committee invited lectures from Susumu Hayashi, Frank Neven, and Damian Niwinski; the papers provided by the invited speakers appear at the front of this volume. In addition to the main conference, two tutorials, 'Introduction to Mu Calculi' by Julian Bradfield and 'Parametrized Complexity' by Martin Grohe, were given on the previous day.
