

TRACK CHAINS

4. DESCRIPTION

The interlocking type track chain consists of drop-forged, heat-treated steel links which are held together by bushings and pins to form a continuous chain. The bushings and pins are a press fit in the links, with the pins pivoting inside of the bushings. The left and right track chains are interchangeable. Each track has a master bushing and pin. The master pin is a press fit in the links and has both ends center drilled for identification. Belleville washers are used in the counterbored portion of the link to seal against the entrance of abrasives. The track shoes are attached to the track links, and they are held in place with special heat-treated cap screws and nuts.

5. MAINTENANCE

The track links have only one wearing surface which contacts the track rollers, front idler and track idlers. However, it usually becomes necessary to replace pins and bushings before the links wear out, and it is a matter of judgment then whether the links are good enough to justify a new set of pins and bushings. Only the wear on the outside of the bushings is visible. Wear on the pins and interior of the bushings is indicated by track "stretch" (forward adjustment of the front idler). The amount of wear

can be determined by measuring the pitch length of the track (distance between centers of pins) under tension and comparing it with the new and maximum allowable pitch lengths listed in Section 1, "SPECIFICATIONS."

Sprocket wear must also be considered in conjunction with track chain wear. Wear of the sprocket teeth decreases the pitch length of the sprocket, while wear of pins and bushings increases the pitch length of the track. The results are that the pitch lengths of the sprocket and track becomes more and more out-of-phase, and the bushings ride higher on the sprocket teeth. Combined wear of sprocket and track should never be allowed to reach this point. Whenever new or rebuilt track chains are installed, the sprocket should also be replaced or interchanged to present the better side of the teeth to the bushings.

Never remove one link to bring a "stretched" track to within the range of proper track adjustment. A track that is worn badly enough to take up the length of one link, will be so far out of pitch that the increased wear on the sprocket will far more than offset the saving obtained by the removal of one link in the track chain. (Refer to "Rotating the Track Pins and Bushings" in Par. 7, "TRACK CHAIN REPAIR.")

CHECKING TRACK TENSION

Place a wooden block approximately one foot in height, under the foremost track shoe lug. Drive the tractor forward until the track chain is tight along the ground and around the sprocket. Apply and lock the brake; stop the engine. Stand on the track between the front idler and the first track idler to accumulate all the chain slack at this point. Place a straightedge on the track so the ends rest over the front idler and track idler. With a ruler, measure the clearance between the bottom of the straightedge and the top of the shoe grouser at the midway point between the idlers. If this clearance is more than 1-1/2 inches or less than one inch, adjust the track tension.

ADJUSTING TRACK TENSION
(REF. NOS. REFER TO ILLUSTR. 3)

Track chains are adjusted by hydraulic pressure. Lubricant is introduced into the hydraulic
