

OPERATION

14. CARBURETOR ADJUSTMENTS

- a. Your motor has a fixed high speed jet. The idle adjustment setting has been preset at the factory, but variations in fuel, altitude and weather conditions may necessitate adjustment. (See Figure 18).
- (1) Engine should start with idle speed knob in Mid-Range position.
- (2) With engine at operating temperature, turn wrist grip handle to slow speed position and adjust idle speed knob clockwise to lean the mixture and counterclockwise for a richer mixture until smooth operation is obtained.
- (3) Upon completion of this setting, motor should run smoothly at slow as well as at all other speeds. Also, motor should accelerate rapidly and not pop on deceleration. If the engine does not respond satisfactorily, repeat Item No. 2.

15. COOLING SYSTEM

- a. A water pump is provided to cool and condense exhaust gases. This pump is located in the column just above the gear housing and operates whenever the motor is in gear. The water inlet holes are on each side of the gear housing just below the cavitation plate. (See Figure 19).
- b. When the motor is in gear and the pump is working properly, a warm spray of water will come out the small holes on the back side of the column just behind the reverse lug.
- c. When the motor is in neutral, there will be no water spray, which is normal.
- d. If the water inlet holes plug or pump fails (no spray when in gear), the engine should be stopped at once and the problem corrected. If water spray is so hot that you cannot hold your hand under the spray, turn off motor and check for leaves or grass stopping the water inlets. If these are clear and water spray is still hot, turn motor off. This indicates cooling system failure. Have cooling system checked.

CAUTION

The water pump has a rubber impeller which can be damaged by operation in excessively silty or sandy water. Operation of motor with inoperative water pump or obstruction in cooling system will cause severe damage due to overheating.

16. PROPELLER SHEAR PIN

- a. The soft "safety" pin shears off when an obstruction is struck at high speed, thus protecting the gears and shafts from damage. When shear pin is broken, the engine will continue to run, however, the propeller will not be rotating.
