Building Interactive Systems Philip Gray, Roger Took, 2013-03-09 Architectures and tools are two important considerations in the construction of interactive computer systems The former is concerned with the optimal structural organisation of systems and the latter with the effective support of the design and management of user interfaces They are regarded as the areas of research most likely to contribute to the development of existing interactive systems in particular by providing improved architectures capable of supporting new styles of interaction and more sophisticated software tools to improve productivity This volume combines the proceedings of two workshops held in York and Glasgow which concentrated on architectures and tools respectively In doing so it addresses the problems of user interface construction from two complementary viewpoints and provides alternative perspectives on many of the central issues Some of the papers are published in expanded form to provide a more comprehensive coverage of the topics and two additional papers have been included which offer a useful insight into issues raised by the workshops The papers address formal and theoretical concerns as well as academic and commercial ones Specific topics covered include novel input models architectures for real time systems and object oriented user interface tools for X widgets NeWS and Smalltalk based applications The papers also include presentations of new tools and architectural designs Building Interactive Systems Architectures and Tools provides

the most extensive recent account of research into the relationship between architectures and tools in the construction of interactive computer systems and will be of interest to researchers postgraduate students and software developers

Naval Anti-Aircraft Guns and Gunnery Norman Friedman, 2014-01-21 This book does for naval anti aircraft defence what the author's Naval Firepower did for surface gunnery it makes a highly complex but historically crucial subject accessible to the layman It chronicles the growing aerial threat from its inception in the First World War and the response of each of the major navies down to the end of the Second highlighting in particular the widely underestimated danger from dive bombing

Central to this discussion is an analysis of what effective AA fire control required and how well each navy's systems actually worked. It also takes in the weapons themselves, how they were placed on ships and how this reflected the tactical concepts of naval AA defence. As would be expected from any Friedman book, it offers striking insights; he argues, for example, that the Royal Navy, so often criticised for lack of air-mindedness, was actually the most alert to the threat, but that its systems were inadequate, not because they were too primitive, but because they tried to achieve too much. The book summarises the experience of WW2, particularly in theatres where the aerial danger was greatest, and a concluding chapter looks at post-1945 developments that drew on wartime lessons. All important guns, directors and electronics are represented in close-up photos and drawings, and lengthy appendices detail their technical data. It is simply another superb contribution to naval technical history by its leading exponent.
