Geriatric Medicine Michael R. Wasserman, Debra Bakerjian, Sunny Linnebur, Sharon Brangman, Matteo Cesari, Sonja Rosen, 2024-02-19 Both volumes sold as a combined set for a one time purchase Older adults represent the most rapidly growing demographic in the U S and in many developed countries around the world The field of geriatric medicine is still relatively young and is only recently seeing a significant increase in peer reviewed literature Medicare and Medicaid expenditures related to older adults are nearly a trillion dollars year in the US How our healthcare system cares for older adults and how those older adults navigate an increasingly complex system is of the utmost importance According to the Institute of Medicine physicians and other healthcare professionals receive an inadequate amount of training in geriatric medicine Geriatric medicine is based on the concept of delivering person centered care with a focus on function and quality of life It is essential that physicians nurse practitioners physician assistants pharmacists social workers and other health care professionals all be knowledgeable about the geriatric approach to care Geriatric medicine varies from most other fields in medicine While many specialties function on the basis of evidence based literature geriatricians and other clinicians caring for older adults must integrate relatively limited evidence with variable physiological changes and complex psychosocial determinants Geriatricians are used to caring for 90 year olds with multiple chronic illnesses Their variable physiology leads to uncertain responses to pharmacotherapy and their personal goals and wishes need to be incorporated into any plan of care Practicing geriatric medicine requires the ability to see patterns But it goes one step further as the rules are constantly in flux Every patient is an individual with particular needs and goals In order to provide true person centered care to older adults one has to incorporate these factors into the decision making process The proposed handbook is designed to present a comprehensive and state of the art update that incorporates existing literature with clinical experience Basic science and the physiology of aging create a background but are not the main focus This is because every chapter has been written through the lens of person centered care This book is about focusing on what matters to the person and how that is not always about pathology and physiology The reader generally will not find simple solutions to symptoms diseases and syndromes In fact the key to caring for geriatric patients is the ability to think both critically and divergently at the same time Geriatrics encompasses multiple disciplines and spans all of the subspecialties It requires knowledge of working within an interdisciplinary team It requires an appreciation of how quality of life varies with each individual and creates treatment and care plans that also vary And most of all it requires a firm commitment to first learning who the person is so that all of the necessary data can be analyzed and integrated into a true person centered plan of care This book aims to serve as an unparalleled resource for meeting these challenges Updated and revised from the previous edition this text features over 40 new peer reviewed chapters new references and a wide array of

useful new tools that are updated on a regular basis by interdisciplinary and interprofessional experts in geriatric medicine

Autonomic Nervous System in Old Age George A. Kuchel, 2019-04-26 In recent years all western industrialized countries and to a growing extent even many developed and developing Asian nations have witnessed a remarkable growth in numbers of older people 1 Future projections anticipate continued increases particularly in numbers of individuals who are 85 years and older 1 Although US statistics have indicated recent declines in disability trends 2 overall numbers of older individuals living with disability and functional dependence are likely to increase given projected increases in life expectancy 3 For example average life expectancy for women born today in the United States is nearly 80 for men it is nearly 75 1 With these considerations in mind many investigators have begun to pay increasing attention to identifying factors which may predict the transition from health and independence to disability and dependence in older individuals eventually providing useful targets for interventions 3 4

Contemporary Geriatric Medicine Steven R. Gambert, 2012-12-06 This volume is the third in the Contemporary Geriatric Medicine series As in previous volumes information is presented in the form of easy to read essays to bring the reader up to date on state of the art developments in the area of geriatric medicine Once again a system approach is utilized In addition several new topics including alcoholism thromboembolic disease and decubitus ulcer management have been introduced to enhance this volume's usefulness to the busy clinician and student Each chapter is not meant to be an exhaustive review of all topics in the field but rather to focus on issues currently receiving a great deal of attention Our goal continues to be to create an exciting approach to contemporary issues in geriatric medicine The editors are once again appreciative for having been given the opportunity to develop this series Appreciation is also expressed to our professional colleagues families and administrative assistants who have enabled this volume to reach fruition As in the past we thank most of all our elderly patients for providing the inspiration and impetus to improve our knowledge and understanding of the health care needs of the elderly Steven R Gambert M D V alhalla New York ix Contents Chapter 1 Geriatric Cardiology and Blood Pressure 1 Edmund H Duthie Jr and Michael H Keelan Jr *Geriatric Medicine* Christine K. Cassel, Rosanne Leipzig, Harvey Jay Cohen, Eric B. Larson, Diane E. Meier, 2006-05-29 Since the publication of the third edition of Geriatric Medicine extraordinary advances have occurred in the science of aging and the potential for biomedical research to give us answers to many if not most of the age related disorders that threaten the quality of life in older years At the most basic level

the successful mapping of the human genome was declared complete in the fall of 2000 Understanding the map of the human genome is as important as understanding the map of genomes of important laboratory species ranging from the microscopic worms and fruit flies used in most classic genetic studies to rodents such as laboratory mice and eventually to primates on which much of the research on the aging human brain is done The genetic maps of all of these species including our own does not answer clinical questions but it does open the door to dramatic rapid and efficient answers to questions about the genetic polymorphisms related to diseases in humans The telomerase story also unfolded since the third edition Telomerase is an enzyme responsible for maintaining the telomeres the redundant DNA portions at the end of chromosomes whose shortening seems to be linked directly to cell senescence apoptosis and the control over cell death which at the level of the individual cell seems to be linked to the decline of organ function and eventually aging and death within the organism
