Energy Consumption of Automatic Ice Makers Installed in Domestic Refrigerators (Nist Tn 1697)

Nist,2014-03-07 This study examines the energy consumption of automatic ice makers installed in domestic refrigerators The purpose of this research is to determine a method of measuring the energy consumption of automatic ice makers that will generate a repeatable and reproducible result This study examined four refrigerator freezers of different configurations one top mount unit one side by side unit and two French door units with bottom freezers The components and operational modes of each ice maker varied among the test subjects This study examined each automatic ice maker and its components and discussed how the operation of each component contributed to the overall energy consumption Two of the units had a single speed compressor that maintained the compartments within a range of temperatures by switching on and off Since this type of unit draws considerable power when the compressor operates and very little when it doesn't a good representation for energy consumption can only be characterized over a number of whole compressor cycles However the unit's ice maker also produces cyclic variation in power draw therefore accurate measurement of the ice maker energy consumption must be characterized over a number whole of ice making cycles Since the unit's compressor cycles and the ice making cycles are not coincident it is difficult to determine the ice making energy using a predefined test period The other two units employed inverter driven variable speed compressors which operated by maintaining a constant part load condition and did not cycle on and off Determination of the ice making efficiency for these units was rather straightforward since data could be examined over a whole number of ice making cycles We also examined the conditions which affect the ice making efficiency The results showed that the ice making efficiency is influenced by the operating temperatures inside the cabinets

Development of a Method to Measure the Energy Consumption of Automatic Icemakers in Domestic Refrigerators With Single Speed Compressors National Institute of Standards and Technology,Nist,2014-02-26 This study examines the energy consumption of automatic ice makers installed in domestic refrigerators This study builds upon the findings of a previous study and examines two refrigerator freezers of different configurations one French door units with bottom freezers and one bottom mount unit that uses a twist tray mechanism to free frozen ice from the icemaker Ice maker energy consumption is difficult to measure because they operate on a periodic cycle which is independent of the compressor cycle used to maintain the cold temperatures in the domestic refrigerator where it is installed therefore methods proposed prior to this study have been subject to significant truncation error due to partial ice maker or compressor cycling The purpose of this study is to define a method of measuring the energy consumption of automatic ice makers that will generate a repeatable and reproducible result Several sets of test data from these units were analyzed and used to decipher the energy consumption of automatic ice makers Through this effort we developed a method of test to characterize ice maker energy consumption which circumvents the inherent problem with its measurement truncation error due to incomplete cycling The

truncation error is avoided by measuring specific parameters with different sections of data from the same data set This method was found to rapidly approach steady state values for the ice maker energy consumption We then analyzed data sets from a prior study and found similar results for the stability of the ice making energy consumption that continuous data over only 6 or 7 ice making cycles are typically sufficient to accurately characterize the energy consumption Development of a Method to Measure the Energy Consumption of Automatic Icemakers in Domestic Refrigerators with Single Speed Compressors David A. Yasher, 2012 **Energy Use of Ice Making in Domestic Refrigerators** Alan Meier, Air and Energy Engineering Research Laboratory, 1992 This study developed and tested a procedure to measure the electrical consumption of ice making in domestic refrigerators The Department of Energy DOE test procedure was modified to consider the energy used for ice making in conventional refrigerators and those equipped with automatic ice makers The procedure assumed that 500 g of ice per day would be produced Using the new ice making test procedure and the existing DOE test as a benchmark four modern efficient refrigerators equipped with automatic ice makers were tested for ice making energy use The test showed that electricity consumption increased about 10% due to ice making The test also confirmed the viability of establishing procedures for measuring energy use of specific loads and other activities related to domestic refrigerators

Energy Use of Icemaking in Domestic Refrigerators, 1996 This study was designed to develop and test a procedure to measure the electrical consumption of ice making in domestic refrigerators The Department of Energy DOE test procedure was modified to include the energy used for icemaking in conventional refrigerators and those equipped with automatic icemakers The procedure assumed that 500 grams of ice would be produced daily Using the new test procedure and the existing DOE test as a benchmark four refrigerators equipped with automatic icemakers were tested for ice making energy use With the revised test gross electricity consumption increased about 10% 100 kWh yr due to automatic icemaking but about 5% 55 kWh yr could be attributed to the special features of the automatic icemaker The test also confirmed the feasibility of establishing procedures for measuring energy use of specific loads and other activities related to domestic refrigerators Field testing and subsequent retesting revealed a 14% increase in energy use *Energy Conservation in Home Refrigerators* Donald N.
