

Experimental design relates to the steps you take to create and systematically follow to confirm a hypothesis, answer a scientific question, or solve a given problem. A good experimental design requires that you understand the subject you are studying well; thus, it is critical that you recognize the objective(s) of the experiment and do some research before planning. You need to check the list of any materials and equipment available in the lab and identify the concepts and techniques you would need to apply to complete the experiment.

For each project (in the lab manual or Canvas), you will find an introduction to the chemistry topic and a description of the project. When you read those sections, you should be able to identify the problem you need to solve and the specific objectives for each project. For example, the first experiment is related to water hardness. Specifically, you will find the concentration of calcium ions present in water from various sources in Florida and you will identify a filtration method that can reduce the hardness. But what steps will you follow to achieve this? Do you know what techniques can be used in the lab to find the concentration of ions? This is where your experimental design skills come into play. For most projects in this lab course, you will find a series of guiding ideas and planning questions that should help you prepare a good plan for your project work.

Some general common questions to ask before you figure out a good plan are:

- Which objective(s) are we trying to accomplish in this experiment?
- Which concepts and techniques do we need to know/review for this experiment?
- Which materials are available to perform this experiment? Which equipment and glassware are required for each technique?
- What safety protocols need to be followed for the project?
- What measurement are we taking and what calculations are required for this experiment?
- What are some possible sources of error and how will we address those errors?

More specific questions relevant to each project are available in the lab manual.

For this experimental design in-class activity:

- 1) Read carefully "*Pre-Lab Plan and Submission*" and open the PDF containing the guidelines for creating and submitting a pre-lab plan. These are available in Canvas under the "*Experimental Design and Literature Search*" Module. Discuss and clarify any questions you may have about the process of creating and submitting pre-lab plans with your group members and/or TA.
- 2) Read the "Introduction" part of **Module 1** (Project 1- Analysis of Florida Water) in Canvas and discuss with your group members how to identify the objective(s) of the project. Where can you find the project description?
- 3) Then, go over each one of the items described in the "Pre-lab Plan Submission" rubric in **Module 1** and start designing your experiment. Your TA will guide you through the process and ask you questions about your plan towards the end of the lab period.

Answer these guiding questions and submit them to Canvas to receive credit:

- 1) What is/are the objective(s) of the project in **Module 1**?
 - Learn how to perform a complexometric titration using EDTA.
 - Determine the hardness of water from various sources.
 - Learn how to use an ion exchange filtration column.
 - Test the water hardness after filtering through an ion exchange column.
- 2) What is water hardness? What metal ions are we looking for?
