

- i. State the relative atomic mass of krypton
- ii. Calculate the density of krypton at r.t.p.

Answer:

- a) Helium has two electrons in its outermost shell while the other Group 0 elements have eight electrons in their outermost shells. All the Group 0 elements have stable electronic configurations. Thus these elements are uncreative and seldom react with other substances. In addition, these elements have very low melting and boiling point and exist as gases under room conditions.
- b) The boiling points of the elements increase down the group.
- c) Helium has a very low density and is unreactive (not flammable)
- d) i) relative mass of krypton is 84
ii) Density of krypton at r.t.p. = $84 / 24 = 3.5 \text{ g/dm}^3$.

14.) The table below shows the physical properties of some transition metals.
