Informatics for the Clinical Laboratory Daniel Cowan, 2005-05-19 This book will highlight all aspects of laboratory informatics with a focus on information management and the corresponding hardware and technical processes involved. In addition to a comprehensive introduction on laboratory informatics, the book emphasizes the importance of information and resource management as opposed to simply covering the role of computers that support the information system. As a Professor of Pathology and the Director of Laboratory Information Services at the University of Texas Medical Branch at Galveston, Dr. Cowan has witnessed the shift in focus in the laboratory from the information generation to information management and increasing resource limitations demand a higher level of management precision than can be gained from manual methods. The American Board of Pathology now requires an increasing sophistication in information management from candidates for certification. Thus, this book is intended for pathologists and residents in pathology, clinical laboratory scientists and laboratory and information managers. Following the broad based introduction on laboratory informatics, the book's topics include computer basics, development and validation of the laboratory information system, computer networks, security and confidentiality on computer systems and networks, total cost of ownership, essential software interfaces, process modeling, artificial intelligence and expert systems, bar coding in the laboratory, image analysis and computer assisted quantitation and telepathology.

mandates from industry groups such as Leapfrog about using information systems to improve health care and the move toward evidence based practice health institutions cannot afford to retain manual practices The installation of multi million dollar computerized health systems represents the very life blood of contemporary clinical operations and a crucial link to the financial viability of institutions Yet the implementation of health information systems is exceptionally complex expensive and often just plain messy The need for improvement in the art and science of systems implementation is clear up to 70 80% of information technology installations fail The reasons are multifaceted ranging from the complexity of the diverse workflows being computerized the intricate nature of health organizations the knowledge and skills of users to other reasons such as strategies for obtaining key executive support weaving through the politics peculiar to the institution and technical facets including the usability of systems Thus the art and science of successfully implementing systems remains deeply layered in elusiveness Still given the pervasiveness of system implementations and the importance of the outcomes this is a critical topic especially for nurses and informatics nurse specialists
