# Cells: Building Blocks of Living Things

by Cindy Sherwood

To build a tower of blocks, you put one block on top of another until it creates a tall structure. With living things, there is a type of building block that does the same thing, creating the structure of who we are. This building block of all living things is called a cell.

A cell that is cut in half will not survive. That makes a cell very special. It is considered the smallest part of an organism that can survive on its own, so it is the most basic unit of life.

the cell. This membrane separates one cell from others and protects it from its outside environment. The membrane also allows some materials to enter and leave the cell.

There are many different types of cells, which serve different purposes in how plants and animals function. There are cells that take in nutrients from food and other cells that turn those nutrients into energy. Some cells provide structure to an organism. Other cells can make copies of themselves. Certain types of cells contain organelles. Just like the name sounds, organelles are similar to small organs of the human body and perform specific tasks necessary for an organism to survive.
