Categories And Computer Science Cambridge Computer Science Texts:

Categories and Computer Science R. F. C. Walters, Richard F. Walters, 1991 Category theory has become increasingly important and popular in computer science and many universities now have introductions to category theory as part of their courses for undergraduate computer scientists The author is a respected category theorist and has based this textbook on a course given over the last few years at the University of Sydney The theory is developed in a straightforward way and is enriched with many examples from computer science Thus this book meets the needs of undergraduate computer scientists and yet retains a level of mathematical correctness that will broaden its appeal to include students of mathematics new to category theory Categories and Computer Science Richard F. Walters, 1991

Categorical Logic and Type Theory B. Jacobs, 2001-05-10 This book is an attempt to give a systematic presentation of both logic and type theory from a categorical perspective using the unifying concept of fibred category Its intended audience consists of logicians type theorists category theorists and theoretical computer scientists

Theory And Formal Methods Of Computing 94: Proceedings Of The Second Imperial College Workshop Chris Hankin, I Mackie, Rajagopal Nagarajan, 1995-10-17 The focus of this workshop was the development of mathematically based techniques of formal specification of system behaviour and the systematic development of implementations The aim is to produce correct efficient implementations in a reliable fashion Topics covered at the workshop include category theory logic domain theory semantics concurrency specification and verification The papers published here range from the purely theoretical to practical applications

Categories and Computer Sciences R. F. C. Walters, 1992 Generic Programming Roland Backhouse, Jeremy Gibbons, 2003-11-25 Generic programming attempts to make programming more efficient by making it more general This book is devoted to a novel form of genericity in programs based on parameterizing programs by the structure of the data they manipulate The book presents the following four revised and extended chapters first given as lectures at the Generic Programming Summer School held at the University of Oxford UK in August 2002 Generic Haskell Practice and Theory Generic Haskell Applications Generic Properties of Datatypes Basic Category Theory for Models of Syntax

Samson Abramsky on Logic and Structure in Computer Science and Beyond Alessandra Palmigiano, Mehrnoosh Sadrzadeh, 2023-08-01 Samson Abramsky's wide ranging contributions to logical and structural aspects of Computer Science have had a major influence on the field This book is a rich collection of papers inspired by and extending Abramsky's work It contains both survey material and new results organised around six major themes domains and duality game semantics contextuality and quantum computation comonads and descriptive complexity categorical and logical semantics and probabilistic computation These relate to different stages and aspects of Abramsky's work reflecting its exceptionally broad scope and his ability to illuminate and unify diverse topics Chapters in the volume include a review of his entire body of work spanning from philosophical aspects to logic programming language theory quantum theory economics and psychology and relating it to a theory of unification of sciences using dual adjunctions The

section on game semantics shows how Abramsky's work has led to a powerful new paradigm for the semantics of computation. The work on contextuality and categorical quantum mechanics has been highly influential and provides the foundation for increasingly widely used methods in quantum computing. The work on comonads and descriptive complexity is building bridges between currently disjoint research areas in computer science relating Structure to Power. The volume also includes a scientific autobiography and an overview of the contributions. The outstanding set of contributors to this volume, including both senior and early career academics, serve as testament to Samson Abramsky's enduring influence. It will provide an invaluable and unique resource for both students and established researchers.

Monoidal Category Theory

Noson S. Yanofsky, 2024-11-05. A comprehensive cutting edge and highly readable textbook that makes category theory and monoidal category theory accessible to students across the sciences. Category theory is a powerful framework that began in mathematics but has since expanded to encompass several areas of computing and science with broad applications in many fields. In this comprehensive text, Noson Yanofsky makes category theory accessible to those without a background in advanced mathematics. Monoidal Category Theory demonstrates the expansive uses of categories and, in particular, monoidal categories throughout the sciences. The textbook starts from the basics of category theory and progresses to cutting edge research. Each idea is defined in simple terms and then brought alive by many real world examples before progressing to theorems and uncomplicated proofs. Richly guided exercises ground readers in concrete computation and application. The result is a highly readable and engaging textbook that will open the world of category theory to many. Makes category theory accessible to non-math majors. Uses easy to understand language and emphasizes diagrams over equations. Incremental iterative approach eases students into advanced concepts. A series of embedded mini-courses cover such popular topics as quantum computing, categorical logic, self-referential paradoxes, databases and scheduling, and knot theory. Extensive exercises and examples demonstrate the broad range of applications of categorical structures. Modular structure allows instructors to fit text to the needs of different courses. Instructor resources include slides.

Antonio Mendez-Vilas, 2005-09-28. The 1st International Meeting on Applied Physics (APHYS 2003) succeeded in creating a new international forum for applied physics in Europe with specific interest in the application of techniques, training, and culture of physics to research areas usually associated with other scientific and engineering disciplines. This book contains a selection of peer-reviewed papers presented at APHYS 2003, held in Badajoz, Spain, from 15th to 18th October 2003, which included the following Plenary Lectures: Nanobiotechnology, Interactions of Cells with Nanofeatured Surfaces and with Nanoparticles, Radiation Protection of Nuclear Workers, Ethical Issues, Chaotic Data Encryption for Optical Communications.
