Fastener Design Manual:

Fastener Design Manual Richard T. Barrett, NASA, 2005 This manual was written for design engineers to enable them to choose appropriate fasteners for their designs Subject matter includes fastener material selection platings lubricants corrosion locking methods washers inserts thread types and classes fatigue loading and fastener torque A section on design criteria covers the derivation of torque formulas loads on a fastener group combining simultaneous shear and tension loads pullout load for tapped holes grip length head styles and fastener strengths The second half of this manual presents general guidelines and selection criteria for rivets and lockbolts To the casual observer the selection of bolts nuts and rivets for a design should be a simple task In reality it is a difficult task requiring careful consideration of temperature corrosion vibration fatigue initial preload and many other factors The intent of this manual is to present enough data on bolt and rivet materials finishes torques and thread lubricants to enable a designer to make a sensible selection for a particular design

Locknuts washers locking methods inserts rivets and tapped holes are also covered [Fastener Design Manual](#) Richard T. Barrett, 1990 [Fastener Design Manual](#) Richard T. Barrett, National Aeronautics and Space Administration

(NASA, 2011-07-27 This manual was written for design engineers to enable them to choose appropriate fasteners for their designs Subject matter includes fastener material selection platings lubricants corrosion locking methods washers inserts thread types and classes fatigue loading and fastener torque A section on design criteria covers the derivation of torque formulas loads on a fastener group combining simultaneous shear and tension loads pullout load for tapped holes grip length head styles and fastener strengths The second half of this manual presents general guidelines and selection criteria for rivets and lockbolts To the casual observer the selection of bolts nuts and rivets for a design should be a simple task In reality it is a difficult task requiring careful consideration of temperature corrosion vibration fatigue initial preload and many other factors The intent of this manual is to present enough data on bolt and rivet materials finishes torques and thread lubricants to enable a designer to make a sensible selection for a particular design Lockouts washers locking methods inserts rivets and tapped holes are also covered Bolts can be made from many materials but most bolts are made of carbon steel alloy steel or stainless steel Stainless steels include both iron and nickel based chromium alloys Titanium and aluminum bolts have limited usage primarily in the aerospace industry Carbon steel is the cheapest and most common bolt material Most hardware stores sell carbon steel bolts which are usually zinc plated to resist corrosion_ The typical ultimate strength of this bolt material is 55 ksi An alloy steel is a high strength carbon steel that can be heat treated up to 300 ksi However it is not corrosion resistant and must therefore have some type of coating to protect it from corrosion Aerospace alloy steel fasteners are usually cadmium plated for corrosion protection_ Bolts of stainless steel CRES are available in a variety of alloys with ultimate strengths from 70 to 220 ksi The major advantage of using CRES is that it normally requires no protective coating and has a wider service temperature range than plain carbon or alloy steels A partial listing of bolt materials is given in table 1 The

following precautions are to be noted

- 1 The bolt plating material is usually the limiting factor on maximum service temperature
- 2 Carbon steel and alloy steel are unsatisfactory become brittle at temperatures below 65 F
- 3 Hydrogen embrittlement is a problem with most common methods of plating unless special procedures are used This subject is covered more fully in the corrosion section
- 4 Series 400 CRES contains only 12 percent chromium and thus will corrode in some environments
- 5 The contact of dissimilar materials can create galvanic corrosion which can become a major problem

Galvanic corrosion is covered in a subsequent section of this manual

Platings and Coatings

Most plating processes are electrolytic and generate hydrogen Thus most plating processes require baking after plating at a temperature well below the decomposition temperature of the plating material to prevent hydrogen embrittlement However heating the plating to its decomposition temperature can generate free hydrogen again Thus exceeding the safe operating temperature of the plating can cause premature fastener failure due to hydrogen embrittlement as well as loss of corrosion protection A summary of platings and coatings is given in table II

Cadmium Plating

The most common aerospace fastener plating material is cadmium Plating is done by electrodeposition and is easy to accomplish However cadmium plated parts must be baked at 375 F for 23 hours within 2 hours after plating to prevent hydrogen embrittlement Since cadmium melts at 600 F its useful service temperature limit is 450 F

The Design of Aircraft Landing Gear Robert Kyle Schmidt, 2021-02-18 The aircraft landing gear and its associated systems represent a compelling design challenge simultaneously a system a structure and a machine it supports the aircraft on the ground absorbs landing and braking energy permits maneuvering and retracts to minimize aircraft drag Yet as it is not required during flight it also represents dead weight and significant effort must be made to minimize its total mass The Design of Aircraft Landing Gear written by R Kyle Schmidt PE B A Sc Mechanical Engineering M Sc Safety and Aircraft Accident Investigation Chairman of the SAE A 5 Committee on Aircraft Landing Gear is designed to guide the reader through the key principles of landing system design and to provide additional references when available Many problems which must be confronted have already been addressed by others in the past but the information is not known or shared leading to the observation that there are few new problems but many new people The Design of Aircraft Landing Gear is intended to share much of the existing information and provide avenues for further exploration The design of an aircraft and its associated systems including the landing system involves iterative loops as the impact of each modification to a system or component is evaluated against the whole It is rare to find that the lightest possible landing gear represents the best solution for the aircraft the lightest landing gear may require attachment structures which don't exist and which would require significant weight and compromise on the part of the airframe structure design With those requirements and compromises in mind The Design of Aircraft Landing Gear starts with the study of airfield compatibility aircraft stability on the ground the correct choice of tires followed by discussion of brakes wheels and brake control systems Various landing gear architectures are investigated together with the details of shock absorber designs Retraction kinematics and mechanisms are studied as well as possible actuation approaches Detailed information on the various hydraulic and electric services commonly found on aircraft and system elements such as dressings lighting and steering are also reviewed Detail design points the process of analysis and a review of the relevant requirements and regulations round out the book content The Design of Aircraft Landing Gear is a landmark work in the industry and a must read for any engineer interested in updating specific skills and students preparing for an exciting career **NASA Tech Briefs** ,1991-10
